6. Comprehension given below is followed by some multiple choice question, Each question has one correct options. Choose the correct option.

Molecular orbitals are formed by the overlap of atomic orbitals. Two

atomic orbitals combine to form two molecular orbitals called bonding molecular orbital (BMO) and anti-bonding molecular orbital (ABMO). Energy of anti-bonding orbital is raised above the parent atomic orbitals that have combined and the energy of the bonding orbital is lowered than the parent atomic orbitals.

energies of various molecular orbitals for elements hydrogen to nitrogen increase in the order

$$\sigma 1s < \sigma^* 1s < \sigma 2s < (\pi 2p_x = \pi 2p_y) < \sigma 2p_z < (\pi^* 2p_x = \pi^* 2p_y) <$$

and For oxygen and fluorine order of energy of molecules orbitals is given below.

$$\sigma 1s < \sigma^* 1s < \sigma 2s < \sigma^* 2s < \sigma p_z < (\pi 2p_x \approx \pi 2p_y) < (\pi^* 2p_x \approx \pi^* 2p_y)$$

Different atomic orbitals of one atom combine with those atoms orbitals of the second atom which have comparable energies and proper orientation.

Further, if the overlapping is head on, the molecular orbital is called sigma, σ and if the overlap is lateral, the molecular orbital is called pi, π .

The molecular orbitals are filled with electrons according to the same rules as followed for filling of atomic orbitals.

However, the order for filling is not the same for all molecules or their

ions. Bond order is one of the most important parameters to compare the strength of bonds.

2. Hydrogen bond is formed between hydrogen atoms and highly electronegative elements. It is of two types - intermolecular and intramolecular. It is a weaker bond than ionic, covalent and metallic bonds.

Which is the correct statement ?

- A. displacement of electrons towards more electronegative atom resulting in fractional positive charge on hydrogen
- B. displacement of electrons towards hydrogen atom resulting in a polar molecule
- C. formation of a bond between hydrogen atoms of one molecule and the other
- D. existence of an attractive force which binds hydrogen atoms together.
