NCERT - NCERT PHYSICS(GUJRATI)

MAGNETISM AND MATTER

Example

1. In Fig 5.4 (b), the magnetic needle has magnetic moment $6.7 \times 10^{-2} Am^2$ and moment of inertia $I = 7.5 \times 10^{-6} Kgm^{-2}$. It performs 10 complete oscillation in 6.70s. What is the magnitude of the magnetic field?

Watch Video Solution

2. A short bar magnet placed with its axis at 30° with an external field of 800 G experiences a torque of 0.016 Nm.

(a) What is the magnetic moment of the magnet ?

(b) What is the work done in moving it from its most stable to most unstable position ?

(c) The bar magnet is replaced by a solenoid of cross-sectional area $2 \times 10^{-4} m^2$ and 1000 turns, but of the same magnetic moment. Determine the current flowing through the solenoid.

Watch Video Solution

3. (a) What happens if a bar magnet is cut into two pieces: (i) transverse to its length, (ii) along its length?

(b) A magnetised needle in a uniform

magnetic field experiences a torque but no net force. An iron nail near a bar magnet, however, experiences a force of attraction in addition to a torque. Why?

(c) Must every magnetic configuration have a north pole and a south pole? What about the field due to a toroid?

(d) Two identical looking iron bars A and B are given, one of which is definitely known to be magnetised. (We do not know which one.) How would one ascertain whether or not both are magnetised? If only one is magnetised, how does one ascertain which one? [Use nothing else but the bars A and B.)

Watch Video Solution

4. What is the magnitude of the equatorial and axial fields due to a bar magnet of length 5.0 cm at a distance of 50 cm from its mid-point? The magnetic moment of the bar magnet is 0.40 A m^2, the same as in Example 5.2.

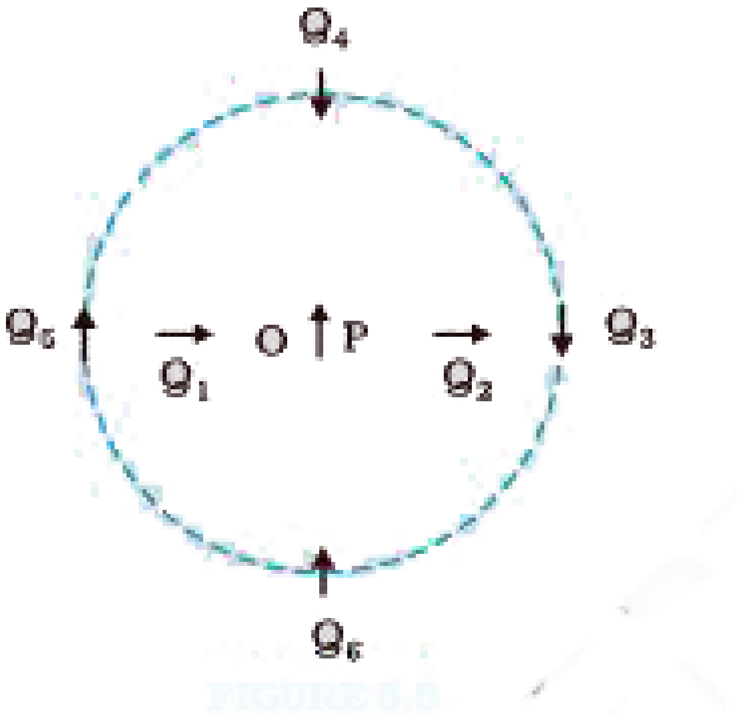
Watch Video Solution

5. Figure 5.5 shows a small magnetised needle P placed at a point O. The arrow shows the direction of its magnetic moment. The other arrows show different positions (and orientations of the magnetic moment) of another identical magnetised needle Q.

(a) In which configuration the system is not in equilibrium?

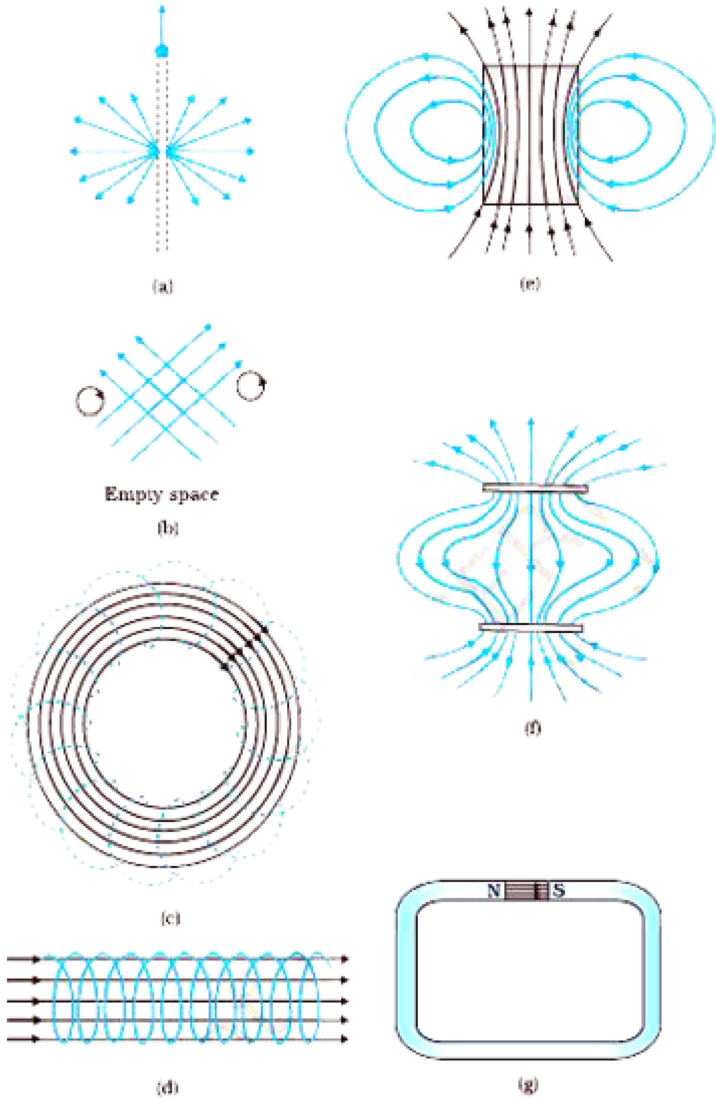
(b) In which configuration is the system in (i) stable, and (ii) unstable equilibrium?

(c) Which configuration corresponds to the lowest potential energy among all the configurations shown?



View Text Solution

6. Many of the diagrams given in Fig 5.7 show magnetic field lines (thick lines in the figure) wrongly. Point out what is wrong with them. Some of them may describe electrostatic field lines correctly. Point out which ones.



Watch Video Solution

7. (a) Magnetic field lines show the direction (at every point) along which a small magnetised needle aligns at the point). Do the magnetic field lines also represent the lines of force on a moving charged particle at every point?

(b) Magnetic field lines can be entirely confined within the core of a toroid, but not within a straight solenoid. Why?

(c) If magnetic monopoles existed, how would the Gauss's law of magnetism be modified?

(d) Does a bar magnet exert a torque on itsell due to its own field? Does one element of a current-carrying wire exert a force on another element of the same wtre?

(e) Magnetic field arises due to charges in motion. Can a system have magnetic moments even though its net charge is zero?

Watch Video Solution

8. The earth magnetic field at the equator is approximately 04.G. Estimate the earth's dipole moment.

Watch Video Solution

9. In the magnetic meridian of a certain place, the horizontal component of the earth's magnetic field is 0.26G and the dip angle is 60°. What is the magnetic field of the earth at this location?

Watch Video Solution

10. A solenoid has a core of a material with relative permeability 400. The windings of the solenoid are insulated from the core and carry a current of 2A. If the number of turns is 1000 per metre, calculate (a) H, (b) M, (c) B and (d) the magnetising current I_m.

Watch Video Solution

11. A domain in ferromagnetic iron is in the form of a cube of side length 1μ m. Estimate the number of iron atoms in the domain and the maximum possible dipole moment and magnetisation of the domain. The molecular mass of iron is 55 g/mole and its density is $7.9 \frac{g}{(cm)^3}$. Assume that each iron atom has a dipole moment of $9.27 \times 10^{-24} \mathrm{Am}^2$.

Watch Video Solution

Exercises

1. Answer the question regarding earth's magnetism:

A vector needs three quantities for its specification. Name the three independent quantities conventionally used to specify the earth's magnetic field.

Watch Video Solution

2. Answer the question regarding earth's magnetism:

The angle of dip at a location in southern India is about 18°. Would you expect a greater or smaller dip angle in Britain?

Watch Video Solution

3. Answer the question regarding earth's magnetism:

If you made a map of magnetic field lines at Melbourne in Australia, would the lines seem to go into the ground or come out of the ground?

Watch Video Solution

4. Answer the question regarding earth's magnetism:

In which direction would a compass free to move in the vertical plane point to, if located right on the geomagnetic north or south pole?

Watch Video Solution

5. Answer the question regarding earth's magnetism:

The earth's field, it is claimed, roughly approximates the field due to a dipole of magnetic moment $8 \times 10^{22} JT^{-1}$ located at its centre. Check the order of magnitude of this number in some way.

Watch Video Solution

6. Answer the question regarding earth's magnetism:

Geologists claim that besides the main magnetic N-S poles, there are several local poles on the earth's surface oriented in different directions. How is such a thing possible at all?

Watch Video Solution

7. The earth's magnetic field varies from point to point in space. Does it also change with time? If so, on what time scale does it change appreciably?

Watch Video Solution

8. The earth's core is known to contain tron. Yet geologists do not regard this as a source of the earth's magnetism. Why?

Watch Video Solution

9. The charged currents in the outer conducting regions of the earth's core are thought to be responsible for earth's magnetism. What might be the battery' (i.e., the source of energy) to sustain these currents?

Watch Video Solution

10. The earth may have even reversed the direction of its field several umes during its bustory of 4 to 5 billion years. How can geologists know about the earth's field in such distant past?

Watch Video Solution

11. The earth's field departs from its dipole shape substantially at large distances (greater than about 30.000 km). What agencies may be responsible for this distortion?

Watch Video Solution

12. Interstellar space has an extremely weak magnetic field of the order of $10^{-12}T$. Can such a weak field be of any significant consequence? Explain.

Watch Video Solution

13. A short bar magnet placed with its axis at 30° with a uniform external magnetic field of 0.25T. T experiences a torque of magnitude equal to $4.5 \times 10^{-2}J$. What is the magnitude of magntic moment of the magnet?

14. A short bar magnet of magnetic moment $m = 0.32 JT^{-1}$ is placed in a uniform magnetic field of 0.15 T. If the bar is free to rotate in the plane of the field, which orientation would correspond to its (a) stable and (b) unstable equilibrium? What is the potential energy of the magnetic in each case?

15. A closely wound solenoid of 800 turns and area of cross section $25 \times 10^{-4} m^2$ carries a current of 3.0 A. Explain the sense in which the solenoid acts like a bar magnet. What is its associated magnetic moment?

Watch Video Solution

16. If the solenoid in Exercise 5.5 is free to tum about the vertical direction and a uniform hortzontal magnetic field of 0.25 T is applied, what is the magnitude of torque on the solenoid when its axis makes an angle of 30° with the direction of applied field?

Watch Video Solution

17. A bar magnet of magnetic moment $1.5JT^{-1}$ lies aligned with the direction of a uniform magnetic field of 0.22 T.

(a) What is the amount of work required by an external torque to turn the magnet so as to align its magnetic moment: (i) normal to the field direction (ii) opposite to the field direction?

(b) What is the torque on the magnet in cases (i) and (ii)?

Watch Video Solution

18. A closely wound solenoid of 2000 turns and area of cross-section $1.6 \times 10^{-4} m^2 ?$ carrying a current of 4.0 A. is suspended through its centre allowing it to turn in a horizontal plane.

(a) What is the magnetic moment associated with the solenoid?

(b) What is the force and torque on the solenoid if a uniform horizontal magnetic field of $7.5 \times 10^{-2} T$ is set up at an angle of 30° with the axis of the solenoid?

Watch Video Solution

19. A circular coil of 16 turns and radius 10 cm carrying a current of 0.75 A rests with its plane normal to an external field of magnitude $5.0 \times 10^{-2} T$. The coil is free to turn about an axis in its plane perpendicular to the field direction. When the coll is turned slightly and released, it oscillates about its stable equilibrium with a frequency of $2.0s^{-1}$. What is the moment of inertia of the coil about its axis of rotation?

Watch Video Solution

20. A magnetic needle free to rotate in a vertical plane parallel to the magnetic meridian has its north up pointing down at 22° with the horizontal. The horizontal component of the earth's magnetic field at the place is known to be 0.35 G. Determine the magnitude of the earth's magnetic field at the place.

Watch Video Solution

21. At a certain location in Africa, a compass points 12° west of the geographic north. The north tip of the magnetic needle of a dip circle placed in the plane of magnetic meridian points 60° above the horizontal. The horizontal component of the earth's held is measured to be 0.16 G. Specify the direction and magnitude of the earth's field at the location.

Watch Video Solution

22. A short bar magnet has a magnetic moment of $0.48JT^{-1}$. Give the direction and magnitude of the magnetic field produced by the magnet at a distance of 10 cm from the centre of the magnet on (a) the axis, (b) the equatorial lines (normal bisector) of the magnet.

Watch Video Solution

23. A short bar magnet placed in a horizontal plane has its axis aligned along the magnetic north-south direction. Null points are found on the axis of the magnet at 14 cm from the centre of the magnet. The earth's magnetic Meld at the place is 0.36 G and the angle of dip 18 zero. What is the total magnetic feld on the normal bisector of the magnet at the same distance as the mull-point (i.e., 14 cm) from the centre of the magnet? At rull points, field due to a magnet 1s equal and opposite to the horizontal component of earth's magnetic field.)

Watch Video Solution

24. If the bar magnet in exercise 5.13 is turned around by 180°, where will the new null points be located?

Watch Video Solution

25. A short bar magnet of magnetic moment $5.25 \times 10^{-2} JT^{-1}$ is placed with its axis perpendicular to the earth's field direction. At what distance from the centre of the magnet, the resultant field is inclined at 45° with earth's field on (a) its normal bisector and (b) its axis. Magnitude of the earth's field at the place is given to be 0.42 G. Ignore the length of the magnet in comparison to the distances involved.

Watch Video Solution

Additional Exercises

1. Why does a paramagnetic sample display greater magnetisation (for the same magnetising field) when cooled?

Watch Video Solution

2. Why is diamagnetism, In contrast, almost Independent of temperature?

Watch Video Solution

3. If a toroid uses bismuth for its core, will the field in the core be (slightly) greater or (slightly) less than when the core is empty?

Watch Video Solution

4. Is the permeability of a ferromagnetic material independent of the magnetic feld? If not, is it more for lower or higher fields?

Watch Video Solution

5. Magnetic field lines are always nearly normal to the surface of a ferromagnet at every point. (This fact is analogous to the static electric field lines being normal to the surface of a conductor at every point.) Why?

Watch Video Solution

6. Would the maximum possible magnetisation of a paramagnetic sample be of the same order of magnitude as the magnetisation of a ferromagnet?

Watch Video Solution

7. Explain qualitatively on the basis of domain picture the lireversibility in the magnetisation curve of a ferromagnet.

Watch Video Solution

8. The hysteresis loop of a soft iron piece has a much smaller area than that of a carbon steel plece. If the material is to go through repeated cycles of magnetisation, which piece will dissipate greater heat energy?

Watch Video Solution

9. A system displaying a hysteresis loop such as a ferromagnet, is a device for storing memory? Explain the meaning of this statement.

Watch Video Solution

10. What kind of ferromagnetic material is used for coating magnetic tapes in a cassette player, or for building 'memory stores in a modern computer?

Watch Video Solution

11. A certain region of space is to be shielded from magnetic fields. Suggest a method

Watch Video Solution

12. A long straight horizontal cable carries a current of 2.5 A in the direction 10° south of west to 10° north of east. The magnetie meridian of the place happens to be 10° west of the geographie meridian. The earth's magnetic field at the location is 0.33 G, and the angle of dip is zero. Locate the line of neutral points (ignore the thickness of the cable)? (At neutral potnts, magnetic field due to a current-carying cable is equal and opposite to the horizontal component of earth's magnetic field.)

Watch Video Solution

13. A telephone cable at a place has four long straight horizontal wires carrying a current of

1.0 A in the same direction east to west. The earth's magnetic field at the place is 0.39 G, and the angle of dip is 35°. The magnetic declination is nearly zero. What are the resultant magnetic fields at points 4.0 cm below the cable ?

Watch Video Solution

14. A compass needle free to turn in a horizontal plane is placed at the centre of circular coil of 30 turns and radius 12 cm. The coil is in a vertical plane making an angle of 45° with the magnetic meridian. When the current in the coil is 0.35 A, the needle points west to east.

(a) Determine the horizontal component of the earth's magnetic field at the location.

(b) The current in the coil is reversed, and the coil is rotated about its vertical axis by an angle of 90° in the anticlockwise sense looking from above. Predict the direction of the needle. Take the magnetic declination at the places to be zero.

Watch Video Solution

15. A magnetic dipole is under the influence of two magnetic fields. The angle between the field directions is 60°, and one of the fields has a magnitude of $1.2 \times 10^{-2} T$. If the dipole comes to stable equilibrium at an angle of 15° with this field, what is the magnitude of the other field?

Watch Video Solution

16. A monoenergetic (18 keV) electron beam initially in the horizontal direction is subjected to a horizontal magnetic field of 0.04 G normal to the initial direction. Estimate the up or down deflection of the beam over a distance of $30cm\left(m_e = 9.11 \times 10^{-31} kg\right)$. [Note : Data in this exercise are so chosen that the answer will give you an idea of the effect of earth's magnetic field on the motion of the electron beam from the electron gun to the screen in a TV set.)

Watch Video Solution

17. A sample of paramagnetic salt contains 2.0×10^{24} atomic dipoles each of dipole moment $1.5 \times 10^{-23} JT^{-1}$. The sample is placed under a homogeneous magnetic field of 0.64 T, and cooled to a temperature of 4.2 K. The degree of magnetic saturation achieved is equal to 15%. What is the total dipole moment of the sample for a magnetic field of 0.98 T and a temperature of 2.8 K ? (Assume Curie's law)

Watch Video Solution

18. A Rowland ring of mean radius 15 cm has 3500 tums of wire wound on a ferromagnetic core of relative permeability 800. What is the magnetic field B in the core for a magnetising current of 1.2 A?

Watch Video Solution

19. The magnetic moment vectors μ_s and μ_l associated with the intrinsic spin angular momentum S and orbital angular momentum l, respectively, of an electron are predicted by quantum theory (and verified experimentally to a high accuracy) to be given by :

$$\vec{\mu}_s = -\left(\frac{e}{m}\right)S, \ \vec{\mu}_l = -\left(\frac{e}{2m}\right)\vec{l}$$

Which of these relations is in accordance with the result expected classically ? Outline the derivation of the classical result.
