## ELECTROMAGENTIC INDUCTION

## Question Bank

1. A flat, circular coil of radius 10 cm has 100 turns of wire. Auniform magnetic field exists in a direction perpendicular to the plane of the coil. This ficld is increasing at the rate of $0.1 \frac{\mathrm{~T}}{\mathrm{~s}}$. Calculate the magnitude of emf induced (in volt) in the coil.
2. A wire loop of area $0.2 m^{2}$ has a resistance of 20 ohm . (A) magnetic field, normal to the loop, initially has a magnifude of $0.25 T$ and is reduced to zero at a uniform rate in $10^{-4} s$. Estimate the resulting current in ampere.

## - Watch Video Solution

3. A long solenoid has 1000 turns. When a current of $4 A$ flows through it, the magnetic flux linked with each tum of the solenoid is $4 \times 10^{-3}(w b)$. The self-inductance (in henry) of the solenoid is

## - Watch Video Solution

4. A condacting circular loop is placed in a uniform magnetic field $0.04 T$ with its plane perpendicular to the magnetic field. The radius of the loop starts shrinking at $2 m \frac{m}{s}$. The indaced emf in the loop whicn the redius is $2 c m$ is $y \pi$ microvolt, then find $y$.
5. A coil having 30 tums of wire, each of area' $10 \mathrm{~cm}^{2}$, is placed with its plane at rigiht angle to a magnetic ficld of $0.1 T$. When the coil is suddenly withdrawn from the field, a gaivanometer in series with the coil indicates that a charge of $10^{-5} \mathrm{C}$ passes around the circuit. What is the combined resistânce (in ohm) of the coil and the galvanometer?

## - Watch Video Solution

6. A metal dise of radins 0.1 m spins about a horizontal axis lyinig in the magnetic meridian' at a speed of 5 revis. If the horizontal componeat of the earth's.field is $B=2 \times 10^{-5} W \frac{b}{m^{2}}$, the potential difference between the centre and the outer edge of the disc is $z \times 10^{-6} V$ Find $z$.

## - Watch Video Solution

7. In a coil of resistance 10 ohm , the induced current developed by changing magnetic flux through it is shown in figure as a function of time. The magnitade of change in flux (in weber) through the coil is '(\#\#CEN_KSR_PHY_JEE_CO23_EO1_007_Q01\#\#)'

8. A body enters in an MRI machine in $10 s$. If the magnctic field is $1.5 T$ and circumference of the MRI mechine is $0.9 m$, then find out the magnitude of emf induced (in milli volt) in the body.

## - Watch Video Solution

9. A long solenoid of radius 2 cm has $100 \frac{\mathrm{turns}}{\mathrm{cm}}$ and carries a current of 5 A . A coil of radius 1 cm having 100 tums and a total resistance of 20 ohm is placed inside the solenoid coraxially, The coil is cornected to a galwanometer and the current in the solenoid is reversed in direction. If
the charge flown through the galvanometer is $k \times 10^{-\infty} C$, then find $k$. (Take $\pi^{2}=10$ )

## - Watch Video Solution

10. In an R-I circuit, $R=4 o h m, L=0.5(H)$ and emf of cell $=6 V$. Thew or $k d o \neq(\in m j) \in$ chang $\in$ gthecurrentom 0.80 A to $0.81 A$ through the circuit is

11. A long solenoid of diameter $0.1 m$ has $2 \times 10^{4}$ turns per metre. At the centre of the solenoid, a coil of 100 turns and radius 0.01 m is placed with its axis coinciding with the solenoid axis. The current in the solenoid reduces at a constant rate to $0 A$ from $4 A$ in 0.05 .If the resistance of the coil is $10 \pi^{2} o h m$, the total charge (in $\mu C$ ) flowing through the coil during this time is
12. A small piece of metal ( $\mu_{r}=20$ ) of volume $10 \mathrm{~cm}^{3}$ has a uniform magnetie field $4 \mathrm{~T} \in$ sideit, Thémag $\neq$ tice $\neq$ igys $\rightarrow$ red $\in$ them $\eta$ lis (alpha)/(pi) J_(3)thenf $\in$ dalpha:

26. A copper disc of radius 10 cm is rotating in magnetic field $B=0.4 G$ with $10 r e \frac{v}{s}$. What will be the potential differenee across the peripheral points of disc?

## - Watch Video Solution

27. An inductor $(L=100 \mathrm{mH})$, a resistor ( $R=100 \mathrm{ohm}$ ) and a battery ( $E=100 \mathrm{~V}$ ) are. initially connected in series as shown in the figure. Afler a long time, the battery is disconnected after short-circuiting the points
$A$ and $B$. The current in the circuit, $1 m s$ after the short-circuit, is $\frac{k}{4}$. Find k.

## - Watch Video Solution

28. A loop made of straight edegs has six corners at $A(0,0,0), B(L, O, 0) C(L, L, 0), D(0, L, 0) E(0, L, L)$ and $F(0,0, L)$. Where $L$ is in meter. A magnetic field $B=B_{0}(\hat{i}+\hat{k}) T$ is present in the region. The flux passing through the loop $A B C D E F A$ (in that order) is

## - Watch Video Solution

29. A rectangular loop of sides 8 cm and 2 cm with a small cut is moving out of a region of uniform magnetic field of magnitude 0.3 T directed normal to the loop. The velocity of the loop is $1 \mathrm{cms}^{-1}$ in the direction normal 'to the (i) longer side, (ii) shorter side of the loop. If the ratio of voltage induced in case (i) to case (ii) is $\alpha$ and the ratio of time for which voltage induced in case (ti) to case (i) is $\beta$, then calculate ( $\alpha \times \beta$ ).
30. In the given circuit, the ratio of $(t)_{1}$ to $i_{2}$ is $\frac{x}{y}$, where $i_{1}$ is the initial (at $t=0$ ) current and $i_{2}$ is steady state (at $t=\infty$ ) current through the battery. Find $(x+y)$.
'(\#\#CEN_KSR_PHY_JEE_CO23_EO1_030_Q09\#\#)'

## - View Text Solution

31. A rectangle loop with a sliding connector of length $l=1.0 m$ is situated in a uniform magnetic field $B=2 T$ perpendicular to the plane of loop. Resistance of connector is $r=2 \Omega$. Two resistance of $6 \Omega$ and $3 \Omega$ are connected as shown in figure. the external force required to keep the
connector moving with a constant velocity $v=2 \mathrm{~m} / \mathrm{s}$ is

## - Watch Video Solution

32. An inductor coil stores 32 J of magnetic field energy and dissiopates energy as heat at the rate of 320 W when a current of 4 A is passed through it. Find the time constant of the circuit when this coil is joined across on ideal battery.

## - Watch Video Solution

33. A time varying voltage $\mathrm{V}=2 \mathrm{t}$ (Volt) is applied across and ideal inductor of inductance $L=2 \mathrm{H}$ as shown in Fig. Then (assume current to be zero at t
$=0$ )

## 2 H

## - Watch Video Solution

34. The ratio of time constant in charging and discharging in the circuit shown in the figure is $\frac{x}{y}$. Find $(x+y)$
'(\#\#CEN_KSR_PHY_JEE_CO23_EO1_O34_Q12\#\#)'

## - View Text Solution

35. The magnetic flux through a stationary loop with a resistanoe $R$ varies during interval of time $T$ as $\phi=$ at ( $T-\mathrm{t}$ ). If the heat generated during this time, neglecting the inductance of the loop, is $\frac{a^{2} T^{3}}{p R}$, then find $p$.
36. As shown in the figare, wire $P Q$ has negligible resistance. $B$, the magnetic field, is coming out of the paper, $\theta$ is a fixed angle mede by $P Q$ travelling smoothly over two condiucting parallel wires separated by a distance $d$, If the current in the wirc for the configuration is $I=\frac{x d V B}{4 R}$, then find $x$.
'(\#\#CEN_KSR_PHY_JEE_CO23_EO1_036_Q13\#\#)'

## - View Text Solution

37. There are two coils $A$ and $B$ separated by some distance. If a curreat of 2 A flows through $A$, a magnetic flux of $10^{-2} W b$ passes through $B$ (no current through B ). If no current passes through $A$ and 'a current of 1 A.passes through $B$, then what is the flux (in $(m W b)$ ) through A ?

## - View Text Solution

38. The induced emf in the loop, if the long wire carries a current of 50 A and the loop has an instantaneous velocity $v=10 \frac{\mathrm{~m}}{\mathrm{~s}}$ at the location $x=0,2 m$ as shown in figure is e microvolt. Caluclate $3 \varepsilon$ (Take $a=0.1 m$ ) '(\#\#CEN_KSR_PHY_JEE_CO23_EO1_038_Q14\#\#)'

## - View Text Solution

39. A small square loop of wire of side $l$ is placed inside a large square loop of wire of side ( $L \gg l$ ). The loops are coplanar and their centres coincide. If the mutual inductance of the system is $p \sqrt{q} \frac{\mu_{0}}{\pi} \frac{l^{2}}{L}$, then find $(p+q)$.

## - View Text Solution

40. A square wire of length $L_{1}$ mass $m$ and resistance $R$ slides without friction on parallel conducting resistanceless rails. The rails are interconinected at the bottom by resistanceless rails so that the wire and the rails form a closed rectangular loop. The plane of the rails is inclined
at an angle $\theta$ with the horizontal and a vertical uniform magnetic field $B$ exists within the frame. If the wire acquires a steady velocity of magnitude $v=\frac{k m g R \sin \theta}{6 B^{2} l^{2}}, \cos ^{2} \theta$
