47. Find the equation of the curve such that the portion of the x-axis cut off between the origin and the tangent at a point is twice the abscissa and which passes through the point (1,2).

48. Find the equation of the curve passing through the point, (5,4) if the sum of reciprocal of the intercepts of the normal drawn at any point P(x,y) on it is 1.

49. Find the equation of the curve passing through the origin if the middle point of the segment of its normal from any point of the curve to the x-axis lies on the parabola $2y^2 = x$.

50. Find the equation of family of curves which intersect the family of curves xy=c at an angle $45°$.

51. Find the orthogonal trajectory of $y^2 = 4ax$ (a being the parameter).

52. The population of a certain is known to increase at a rate proportional to the number of people presently living in the country. If after two years the population has doubled, and after three years the population is 20,000 estimates the number of people initially living in the country.

53. What constant interest rate is required if an initial deposit placed into an account accrues interest compounded continuously is to double its value in six years? $(\ln|x| = 0.6930)$

54. Suppose that a mothball loses volume by evaporation at a rate proportional to its instantaneous area. If the diameter of the ball decreases from 2cm to 1cm in 3 months, how long will it take until the ball has practically gone?

55. A body at a temperature of $50^0 F$ is placed outdoors where the temperature is $100^0 F$. If the rate of change of the temperature of a body is proportional to the temperature difference between the body and its surrounding medium. If after 5 min the temperature of the body is $60^0 F$,

find (a) how long it will take the body to reach a temperature of 75 ˆ 0 F

and (b) the temperature of the body after 20 min.

56. Find the time required for a cylindrical tank of radius r and height H to empty through a round hole of area a at the bottom. The flow through the hole is according to the law $v(t) = k\sqrt{2gh(t)}$, where $v(t)$ and $h(t)$, are respectively, the velocity of flow through the hole and the height of the water level above the hole at time t, and g is the acceleration due to gravity.

57. A country has a food deficit of 10%. Its population grows continuously at a rate of 3% per year. Its annual food production every year is 4% more than that of the last year. Assuming that the average food requirement per person remains constant, prove that the country

will become self-sufficient in food after n years, where n is the smallest integer bigger than or equal to $\dfrac{\ln 10 - \ln 9}{\ln(1.04) - 0.03}$

58. A hemi-spherical tank of radius 2 m is initially full of water and has an outlet of $12cm^2$ cross-sectional area at the bottom. The outlet is opened at some instant. The flow through the outlet is according to the law $v(t) = 0.6\sqrt{2gh(t)}$, where $v(t)$ and $h(t)$ are, respectively, the velocity of the flow through the outlet and the height of water level above the outlet and the height of water level above the outlet at time t, and g is the acceleration due to gravity. Find the time it takes to empty the tank.

EXAMPLES

1. Solve $\dfrac{x + y\frac{dy}{dx}}{y - x\frac{dy}{dx}} = x^2 + 2y^2 + \dfrac{y^4}{x^2}$

2. Solve :

$$\left\{x\cos\left(\frac{y}{x}\right) + y\sin\left(\frac{y}{x}\right)\right\}ydx = \left\{y\sin\left(\frac{y}{x}\right) - x\cos\left(\frac{y}{x}\right)\right\}xdy$$

3. Solve $\dfrac{dy}{dx} = \dfrac{(x+y)^2}{(x+2)(y-2)}$

4. Solve $y\left(\dfrac{dy}{dx}\right)^2$

5. If $y + \dfrac{d}{dx}(xy) = x(\sin x + \log x)$, find $y(x)$.

6. If $\displaystyle\int_a^x ty(t)\,dt = x^2 + y(x),$ then find $y(x)$

7. Given a function ' g' which has a derivative $g'(x)$ for every real x and satisfies $g'(0) = 2$ and $g(x + y) = e^y g(x) + e^x g(y)$ for all x and y then: Find g(x).

8. Solve $\dfrac{dy}{dx} = \dfrac{s \in}{\sin 2y - x \cos y}$

9. Solve:

$$\frac{dy}{dx} + \frac{3y}{x} = g(x), \text{ where g(x)} = \begin{cases} 1 & \text{if } 0 \le x \le 1 \\ \frac{1}{x} & \text{if } x > 1 \end{cases}$$

$y\left(\frac{1}{2}\right) = \frac{1}{8}$ and y(x) is continous on $[0, \infty]$.

15. Given two curves: $y = f(x)$ passing through the point $(0, 1)$ and $g(x) = \int_{-\infty}^{x} f(t)dt$ passing through the point $\left(0, \dfrac{1}{n}\right)$. The tangents drawn to both the curves at the points with equal abscissas intersect on the x-axis. Find the curve $y = f(x)$.

16. A cyclist moving on a level road at 4 m/s stops pedalling and lets the wheels come to rest. The retardation of the cycle has two components: a constant 0.08 m/s^2 due to friction in the working parts and a resistance of 0. 02v^2 /m , where v is speed in meters per second. What distance is traversed by the cycle before it comes to rest? (consider 1n 5=1.61).

17. The force of resistance encountered by water on a motor boat of mass m going in still water with velocity v is proportional to the velocity v. At $t = 0$ when its velocity is v_0, then engine shuts off. Find an expression

for the position of motor boat at time t and also the distance travelled by the boat before it comes to rest. Take the proportionality constant as $k > 0$.

18. A and B are two separate reservoirs of water. Capacity of reservoir A is double the capacity of reservoir B. Both the reservoirs are filled completely with water, their inlets are closed and then the water is released simultaneously from both the reservoirs. The rate of flow of water out of each reservoir at any instant of time is proportional to the quantity of water in the reservoir at the time. One hour after the water is released, the quantity of water is reservoir A is $1\frac{1}{2}$ times the quantity of water in reservoir B. After how many hours do both the reservoirs have the same quantity of water?

19. Consider a tank which initially holds V_0 liter of brine that contains a lb of salt. Another brine solution, containing b lb of salt per liter is poured into the tank at the rate of $eL/\min$. The problem is to find the amount of salt in the tank at any time t.

Let Q denote the amount of salt in the tank at any time. The time rate of change of Q, $\dfrac{dQ}{dt}$, equals the rate at which salt enters the tank at the rate at which salt leaves the tank. Salt enters the tank at the rate of be lb/min.

To determine the rate at which salt leaves the tank, we first calculate the volume of brine in the tank at any time t, which is the initial volume V_0 plus the volume of brine added et minus the volume of brine removed ft.

Thus, the volume of brine at any time is

$$V_0 + et - ft$$

The concentration of salt in the tank at any time is $Q/(V_0 + et - ft)$, from which it follows that salt leaves the tank at the rate of

$$f\left(\frac{Q}{V_0 + et - ft}\right) \text{ lb/min. Thus,}$$

$$\frac{dQ}{dt} = be - f\left(\frac{Q}{V_0 + et - ft}\right) Q = be$$

9. Let C be a curve such that the normal at any point P on it meets x-axis and y-axis at A and B respectively. If BP : PA = 1 : 2 (internally) and the curve passes through the point (0, 4), then which of the following alternative(s) is/are correct?

   A. The curves passes through $\left(\sqrt{10}, \; -6\right)$.

B. The equation of tangent at $(4, 4\sqrt{3})$ is $2x + \sqrt{3}y = 20$.

C. The differential equation for the curve is yy' + 2x = 0.

D. The curve represents a hyperbola.

Answer: A::D

10. The normal at a general point (a, b) on curve makes an angle θ with x-axis which satisfies $b(a^2 \tan\theta - \cot\theta) = a(b^2 + 1)$. The equation of curve can be

A. $y = e^{x^2/2} + c$

B. $\log ky^2 = x^2$

C. $y = ke^{x^2/2}$

D. $x^2 - y^2 = k$

Answer: B::C::D

Comprehension Type

1. Tangent is drawn at the point (x_i, y_i) on the curve $y = f(x)$, which intersects the x-axis at $(x_{i+1}, 0)$. Now, again a tangent is drawn at (x_{i+1}, y_{i+1}) on the curve which intersect the x-axis at $(x_{i+2}, 0)$ and the process is repeated n times, i.e. $i = 1, 2, 3; n$. If $x_1, x_2, x_3, ; x_n$ from an arithmetic progression with common difference equal to $(\log)_2 e$ and curve passes through $(0, 2)$. Now if curve passes through the point $(-2, k)$, then the value of k is____

A. (1, 4)

B. (5, 1/16)

C. (2, 1/2)

D. None of these

Answer: B

2. Tangent is drawn at the point (x_i, y_i) on the curve y = f(x), which intersects the x-axis at $(x_{i+1}, 0)$. Now again tangent is drawn at (x_{i+1}, y_{i+1}) on the curve which intersects the x-axis at $(x_{i+2}, 0)$ and the process is repeated n times i.e. i = 1, 2, 3,.......,n.

If $x_1, x_2, x_3, ..., x_n$ form a geometric progression with common ratio equal to 2 and the curve passes through (1, 2), then the curve is

    A. circle

    B. hyperbola

    C. ellipse

    D. parabola

Answer: B
