## MOVING CHARGES AND MAGNETISM

Exercise

1. A circular coil of wire consisting of 100 turns,
each of radius 8.0 cm carries a current of 0.40
A. What is the magnitude of the magnetic field B at the centre of the coil?

## - Watch Video Solution

2. A long straight wire carries a current of 35 A .

What is the magnitude of the field $B$ at a point
20 cm from the wire?

- Watch Video Solution

3. A long straight wire in the horizontal plane carries a current of 50 A in north to south direction. Give the magnitude and direction of $B$ at a point 2.5 m east of the wire.

## D Watch Video Solution

4. A horizontal overhead power line carries a
current of 90 A in east to west direction. What is the magnitude and direction of the
magnetic field due to the current 1.5 m below the line?

## D Watch Video Solution

5. What is the magnitude of magnetic force per unit length on a wire carrying a current of 8 A and making an angle of $30^{\circ}$ with the direction of a uniform magnetic field of 0.15 T ?
6. A 3.0 cm wire carrying a current of 10 A is
placed inside a solenoid perpendicular to its
axis. The magnetic field inside the solenoid is
given to be 0.27 T . What is the magnetic force on the wire?

## D Watch Video Solution

7. Two long and parallel straight wires $A$ and $B$
carrying currents of 8.0 A and 5.0 A in the same direction are separated by a distance of
4.0 cm . Estimate the force on a 10 cm section of wire $A$.

## - Watch Video Solution

8. A closely wound solenoid 80 cm long has 5
layers of windings of 400 turns each. The diameter of the solenoid is 1.8 cm . If the current carried is 8.0 A . estimate the magnitude of $B$ inside the solenoid near its centre.
9. A square coil of side 10 cm consists of 20
turns and carries a current of 12 A . The coil is suspended vertically and the normal to the plane of the coil makes an angle of $30^{\circ}$ with the direction of a uniform horizontal magnetic field of magnitude 0.80 T . What is the magnitude of torque experienced by the coil?

## D Watch Video Solution

10. Two moving coil meters, $M_{1}$ and $M_{2}$ have the following particulars: $R_{1}=10 \Omega, N_{-} 1=30$.
$A_{1}=3.6 \times 10^{-3} \mathrm{~m}^{2}, B_{1}=0.25 \mathrm{~T} R_{2}=14 \Omega, N_{2}=$
42, $A_{2}=1.8 X x 10^{-3} m^{2}, B_{2}=0.50 \mathrm{~T}$ (The spring
constants are identical for the two meters).

Determine the ratio of current sensitivity

## D Watch Video Solution

11. Two moving coil meters, $M_{1}$ and $M_{2}$ have the following particulars: $R_{1}=10 \Omega, N_{-} 1=30$.
$A_{1}=3.6 \times 10^{-3} m^{2}, B_{1}=0.25 \mathrm{~T} R_{2}=14 \Omega, N_{2}=$ 42, $A_{2}=1.8 X x 10^{-3} \mathrm{~m}^{2}, B_{2}=0.50 \mathrm{~T}$ (The spring constants are identical for the two meters).

Determine the ratio of voltage sensitivity of
$M_{2}$ and $M_{1}$.

## D Watch Video Solution

12. In a chamber, a uniform magnetic field of
6.5 G $\quad\left(1 G=10^{-4} T\right)$ is maintained. An electron is shot into the field with a speed of
$4.8 \times 10^{6} \mathrm{~ms}^{-1}$ normal to the field. Explain
why the path of the electron is a circle.
Determine the radius of the circular orbit.
$\left(e=1.5 \times 10^{-19} C . m_{e}=9.1 x 10^{-31} k g\right)$

## - Watch Video Solution

13. In a chamber, a uniform magnetic field of
6.5 $\mathrm{G}(1 \mathrm{G}=10-4 \mathrm{~T})$ is maintained. An electron
is shot into the field with a speed of $4.8 \times 106$ $\mathrm{m} \mathrm{s}-1$ normal to the field. $(\mathrm{e}=1.6 \times 10-19 \mathrm{C}, \mathrm{me}=$
$9.1 \times 10-31 \mathrm{~kg})$. Obtain the frequency of revolution of the electron in its circular orbit.

Does the answer depend on the speed of the electron? Explain

## D Watch Video Solution

14. A circular coil of 30 turns and radius 8.0 cm
carrying a current of 6.0 A is suspended
vertically in a uniform horizontal magnetic
field of magnitude 1.0 T. The field lines make an angle of $60^{\circ}$ with the normal of the coil.

Calculate the magnitude of the counter
torque that must be applied to prevent the coil from turning.

## D Watch Video Solution

15. A circular coil of 30 turns and radius 8.0 cm
carrying a current of 6.0 A is suspended
vertically in a uniform horizontal magnetic
field of magnitude 1.0 T. The field lines make an angle of $60^{\circ}$ with the normal of the coil.

Calculate the magnitude of the counter torque that must be applied to prevent the
coil from turning. Would your answer change, if the circular coil in (a) were replaced by a planar coil of some irregular shape that encloses the same area? (All other particulars are also unaltered.)

## D Watch Video Solution

16. Two concentric circular coils $X$ and $Y$ of radii

16 cm and 10 cm , respectively, lie in the same
vertical plane containing the north to south direction. Coil X has 20 turns and carries a
current of 16 A , coil Y has 25 turns and carries
a current of 18 A . The sense of the current in X
is anticlockwise, and clockwise in Y , for an observer looking at the coils facing west. Give the magnitude and direction of the net magnetic field due to the coils at their centre.

## D Watch Video Solution

17. A magnetic field of $100 \mathrm{G}\left(1 G=10^{-4} T\right)$ is
required which is uniform in a region of linear dimension about 10 cm and area of cross-
section about $10^{-3} m^{2}$. The maximum currentcarrying capacity of a given coil of wire is 15 A and the number of turns per unit length that can be wound round a core is at most 1000 turns $m^{-1}$. Suggest some appropriate design particulars of a solenoid for the required purpose. Assume the core is not ferromagnetic.

## Watch Video Solution

18. For a circular coil of radius R and N turns carrying current $I$, the magnitude of the magnetic field at a point on its axis at a distance $x$ from its centre is given by, $B=\frac{\mu_{0} I R^{2} N}{2\left(x^{2}+R^{2}\right)^{\frac{3}{2}}}$. Show that this reduces to
the familiar result for field at the centre of the coil.
19. For a circular coil of radius R and N turns carrying current $I$, the magnitude of the magnetic field at a point on its axis at a distance $x$ from its centre is given by, $B=\frac{\mu_{0} I R^{2} N}{2\left(x^{2}+R^{2}\right)^{\frac{3}{2}}}$. Consider two parallel co$2\left(x^{2}+R^{2}\right)^{\frac{3}{2}}$
axial circular coils of equal radius $R$, and number of turns N , carrying equal currents in
the same direction, and separated by a distance R. Show that the field on the axis around the mid-point between the coils is uniform over a distance that is small as
compared to $R$, and is given by,
$B=0.72 \frac{\mu_{0} N I}{R}$ approximately.

## - Watch Video Solution

20. A toroid has a core (non-ferromagnetic) of inner radius 25 cm and outer radius 26 cm , around which 3500 turns of a wire are wound.

If the current in the wire is 11 A , what is the magnetic field outside the toroid.

## - Watch Video Solution

21. A toroid has a core (non-ferromagnetic) of inner radius 25 cm and outer radius 26 cm , around which 3500 turns of a wire are wound.

If the current in the wire is 11 A , what is the magnetic field inside the core of the toroid.

## D Watch Video Solution

22. A toroid has a core (non-ferromagnetic) of inner radius 25 cm and outer radius 26 cm , around which 3500 turns of a wire are wound.

If the current in the wire is 11 A , what is the
magnetic field in the empty space surrounded by the toroid.

## D Watch Video Solution

23. Answer the following questions: $A$ magnetic field that varies in magnitude from point to point but has a constant direction
(east to west) is set up in a chamber. A
charged particle enters the chamber and travels undeflected along a straight path with
constant speed. What can you say about the initial velocity of the particle?

## D Watch Video Solution

24. Answer the following questions: A charged
particle enters an environment of a strong and non-uniform magnetic field varying from
point to point both in magnitude and direction, and comes out of it following a complicated trajectory. Would its final speed
equal the initial speed if it suffered no

## collisions with the environment?

## D Watch Video Solution

25. Answer the following questions:An
electron travelling west to east enters a chamber having a uniform electrostatic field in north to south direction. Specify the direction in which a uniform magnetic field should be set up to prevent the electron from deflecting
from its straight line path.

## Watch Video Solution

26. An electron emitted by a heated cathode and accelerated through a potential difference of 2.0 kV , enters a region with uniform magnetic field of 0.15 T . Determine the trajectory of the electron if the field is transverse to its initial velocity.

## - Watch Video Solution

27. An electron emitted by a heated cathode and accelerated through a potential difference of 2.0 kV , enters a region with uniform magnetic field of 0.15 T . Determine the trajectory of the electron if the field makes an angle of $30^{\circ}$ with the initial velocity.

## - Watch Video Solution

28. A magnetic field set up using Helmholtz
coils is uniform in a small region and has a
magnitude of 0.75 T . In the same region, a uniform electrostatic field is maintained in a direction normal to the common axis of the coils. A narrow beam of (single species)
charged particles all accelerated through 15 kV enters this region in a direction perpendicular to both the axis of the coils and the electrostatic field. If the beam remains undeflected when the electrostatic field is $9.0 \times 10^{5} \mathrm{Vm}^{-1}$ make a simple guess as to what the beam contains. Why is the answer not unique?
29. A straight horizontal conducting rod of length 0.45 m and mass 60 g is suspended by two vertical wires at its ends. A current of 5.0 A
is set up in the rod through the wires. What magnetic field should be set up normal to the conductor in order that the tension in the wires is zero?
30. A straight horizontal conducting rod of length 0.45 m and mass 60 g is suspended by two vertical wires at its ends. A current of 5.0 A is set up in the rod through the wires. What will be the total tension in the wires if the direction of current is reversed keeping the magnetic field same as before? (Ignore the mass of the wires.) $g=9.8 \mathrm{~ms}^{-2}$.

## - Watch Video Solution

31. The wires which connect the battery of an automobile to its starting motor carry a current of 300 A (for a short time). What is the force per unit length between the wires if they are 70 cm long and 1.5 cm apart? Is the force attractive or repulsive?

## - Watch Video Solution

32. A uniform magnetic field of 1.5 T exists in a cylindrical region of radius 10.0 cm , its
direction parallel to the axis along east to
west. A wire carrying current of 7.0 A in the north to south direction passes through this region. What is the magnitude and direction of the force on the wire if, the wire intersects the axis.

## D Watch Video Solution

33. A uniform magnetic field of 1.5 T exists in a
cylindrical region of radius10.0 cm, its
direction parallel to the axis along east to
west. A wire carrying current of 7.0 A in the north to south direction passes through this
region. What is the magnitude and direction of the force on the wire if, the wire is turned from N-S to northeast-northwest direction,

## D Watch Video Solution

34. A uniform magnetic field of 1.5 T exists in a cylindrical region of radius 10.0 cm , its direction parallel to the axis along east to west. A wire carrying current of 7.0 A in the
north to south direction passes through this
region. What is the magnitude and direction of the force on the wire if, the wire in the N-S direction is lowered from the axis by a distance of 6.0 cm ?

## D Watch Video Solution

35. A uniform magnetic field of 3000 G is established along the positive z-direction. A rectangular loop of sides 10 cm and 5 cm carries a current of 12 A . What is the torque on
the loop shown in Fig. 4.28? What is the force?

Is case corresponds to stable equilibrium? :

## D Watch Video Solution

36. A uniform magnetic field of 3000 G is established along the positive z-direction. A
rectangular loop of sides 10 cm and 5 cm carries a current of 12 A . What is the torque on the loop shown in Fig. 4.28? What is the force ? is case corresponds to stable equilibrium? :

37. A uniform magnetic field of 3000 G is established along the positive z-direction. A rectangular loop of sides 10 cm and 5 cm carries a current of 12 A . What is the torque on the loop shown in Fig. 4.28? What is the force ? is case corresponds to stable equilibrium? :

## - Watch Video Solution

38. A uniform magnetic field of 3000 G is
established along the positive z-direction. A
rectangular loop of sides 10 cm and 5 cm
carries a current of 12 A . What is the torque on
the loop shown in Fig.? What is the force ? is
case corresponds to stable equilibrium? :

## - Watch Video Solution

39. A uniform magnetic field of 3000 G is established along the positive $z$-direction. A
rectangular loop of sides 10 cm and 5 cm carries a current of 12 A . What is the torque on the loop shown in fig.? What is the force ? is case corresponds to stable equilibrium? :

D Watch Video Solution
40. A uniform magnetic field of 3000 G is established along the positive z -direction. A rectangular loop of sides 10 cm and 5 cm carries a current of 12 A . What is the torque on
the loop shown in Fig. 4.28? What is the force
?is case corresponds to stable equilibrium? :

## D Watch Video Solution

41. A circular coil of 20 turns and radius 10 cm
is placed in a uniform magnetic field of 0.10 T
normal to the plane of the coil. If the current
in the coil is 5.0 A , what is the total torque on
the coil, (The coil is made of copper wire of cross-sectional area $10^{-5} \mathrm{~m}^{2}$, and the free electron density in copper is given to be about $10^{29} m^{-3}$.)

## D Watch Video Solution

42. A circular coil of 20 turns and radius 10 cm
is placed in a uniform magnetic field of 0.10 T normal to the plane of the coil. If the current
in the coil is 5.0 A , what is the total force on the coil, (The coil is made of copper wire of cross-sectional area $10^{-5} \mathrm{~m}^{2}$, and the free electron density in copper is given to be about $10^{29} m^{-3}$.)

## D Watch Video Solution

43. A circular coil of 20 turns and radius 10 cm
is placed in a uniform magnetic field of 0.10 T normal to the plane of the coil. If the current in the coil is 5.0 A , what is the average force on
each electron in the coil due to the magnetic
field? (The coil is made of copper wire of crosssectional area $10^{-5} \mathrm{~m}^{2}$, and the free electron density in copper is given to be about $10^{29} m^{-3}$.)

## D Watch Video Solution

44. A solenoid 60 cm long and of radius 4.0 cm
has 3 layers of windings of 300 turns each. A
2.0 cm long wire of mass 2.5 g lies inside the solenoid (near its centre) normal to its axis,
both the wire and the axis of the solenoid are
in the horizontal plane. The wire is connected through two leads parallel to the axis of the solenoid to an external battery which supplies
a current of 6.0 A in the wire. What value of current (with appropriate sense of circulation) in the windings of the solenoid can support the weight of the wire? $g=9.8 \mathrm{~ms}^{-2}$.

## - Watch Video Solution

45. A galvanometer coil has a resistance of
$12 \Omega$ and the metre shows full scale deflection
for a current of 3 mA . How will you convert the metre into a voltmeter of range 0 to 18 V ?

## D Watch Video Solution

46. A galvanometer coil has a resistance of
$15 \Omega$ and the metre shows full scale deflection
for a current of 4 mA . How will you convert the metre into an ammmeter of range 0 to 6 A ?
