BOOKS - HC VERMA PHYSICS (ENGLISH)

ELECTRIC CURRENT THROUGH GASES

Example

1. The work function of a thermionic emitter is 4.5eV.

By what factor does the thermionic current increase if

its temperature is raised from 1500K
ightarrow 2000K?

2. When the plate voltage applied to a diode value is changed from 40V to 42V, the plate current increases from $50mA \rightarrow 60mA$. Calculate the dynamic plate resistance at the operating condition.

Watch Video Solution

Worked Out Example

1. The mean free path of the electrons in a discharge tube is 20 cm. The tube itself is 10cm long. What is the length of the Crookes dark space?

2. Consider a cylindrical tube closed at one end and fitted with a conducting, movable piston at the other end. A cathode is fixed in the tube near the closed end and an anode is fixed with the piston. A gas is filled in the tube at pressure p. Using Paschen equation V = f(pd), show that the sparking potential does not change as the piston is slowly moved in or out. Assume that the temperature does not change in the process.

3. The number of thermions emitted in a given time increases 100 times as the temperature of the emitting surface is increased from $600K \rightarrow 800K$. Find the work function of the emitter. Boltzmann constant $k = 8.62 \times 10^{-8} eV k^{-1}$.

4. The constant A in the Richordson-Dushman equation is $60 \times 10^4 Am^{-2}K^{-2}$ for tungsten. A tungsten cathode has a total surface area of $2.0 \times 10^{-5}m^2$ and operates at 2000K. The work function of tungsten is 4.55eV. Calculate the electric current due to thermionic emission.

5. Calculate the saturation thermionic current if 120W is applied to a thoriated-tungsten filament of surface area $1.0cm^2$. Assume that the surface radiates like a blackbody. The required constants are $A = 3 \times 10^4 Am^{-2} - K^2$, $\varphi = 2.6eV, k = 8.62 \times 10^{-5} eV kK^{-1}$ and $\sigma = 6 \times 10^{-8} W m^{-2} K^{-4}$

View Text Solution

6. In a Millikan-type oil-drop experiment, the plates are 8mm apart. An oil drop is found to remain at rest when the upper plate is at a potential 135V higher than that of the lower one. When the electric field is switched off, the drop is found to fall a distance of 2.0mm in 36 seconds with a uniform speed. Find (a) the charge on the drop and (b) the number of electrons attached to this drop. Density of oil $k=880kgm^{-3}$ and coefficient of viscosity of $air = 180 \mu poise.$

View Text Solution

7. Show that the dynamic plate resistance of a diode is $2\frac{V}{3}i$ where V and i are the plate voltage and the plate current respectively. Assume Langmuir-Child equation to hold.

8. The mutual conductance of a triode value is $2.5mil \lim ho$. Find the change in the plate current if

the grid voltage is changed from -2.0V to 4.5V.

9. A triode value has amplification factor 21 and dynamic plate resistance $10k\Omega$. This is used as an amplifier with a load of $20k\Omega$). Find the gain factor of the amplifier.

1. Cathode rays constitute a stream of

A. electrons

B. protons

C. positive ions

D. negative ions

Answer: A

> Watch Video Solution

2. Let i_0 be the thermionic current from a metal surface when the absolute temperature of the surface is T_0 . The temperature is slowly increased and the thermionic current is measured as a function of temperature. Which of the following plots may

3. When the diode shows saturated current, dynamic

plate resistance is

A. zero

B. infinity

C. indeterminate

D. different for different diodes

4. A diode, a resistor and a 50HzAC source are connected in series. The number of current pulses per second through the resistor is

A. 25

B. 50

C. 100

D. 200

Answer: B

5. A triode is operated in the liner region of its characteristics. If the plate voltage is slightly increased, the dynamic plate resistance will

A. increase

B. decrease

C. remain almost the same

D. become zero

Answer: C

6. The plate current in a triode value is maximum when the potential of the grid is

A. positve

B. zero

C. negative

D. nonpositive

Answer: A

7. The amplification factor of a triode operating in the

linear region depends strongly on

A. the temperature of the cathode

B. the plate potential

C. the grid potential

D. the separations of the grid from the cathode

and the anode

Answer: D

1. Electric conduction takes place in a discharge tube due to the movement of

A. positive ions

B. negative ions

C. electrons

D. protons

Answer: A::B::C

2. Which of the following are true for cathode ray?

A. It travels along straight lines

B. It emits X-ray when strikes a metal

C. It is an electromagnetic wave

D. It is not deflected by magnetic field

Answer: A::B::C

Watch Video Solution

3. Because of the space charge in a diode valve,

A. the plate current decreases

B. the plate voltage increase

C. the rate of emission of thermions increases

D. the saturation current increases

Answer: A

4. The saturation current in a triode valve can be

changed by changing

A. the grid voltage

B. the plate voltage

C. theseparation between the grid and the

cathode

D. the temperature of the cathode

Answer: D

Watch Video Solution

5. The plate current in a diode is zero. It is possible

that

A. the plate voltage is zero

B. the plate voltage is slightly negative

C. the plate voltage is slightly positive

D. the temperature of the filament is low

Answer: A::B::C::D

Exercise

1. A discharge tube contains helium at a low pressure. A large potential difference is applied across the tube. Consider a helium atom that has just been ionized due to the detachment of an atomic electron. Find the ratio of the distance travelled by the free electron to that by the positive ion in a short time dt

after the ionization.`

2. A molecule of a gas, filled in a discharge tube, gets ionized when an electron is detached from it. An electric field of $5.0kVm^{-1}$ exists in the vicinity of the event. (a) Find the distance travelled by the free electron in $1\mu s$ assuming no collision. (b) If the mean free path of the electron is 1.0mm, estimate the time of transit of the free electron between successive collisions.

3. The mean free path of electrons in the gas in a discharge tube is inversely proportional to the pressure inside it. The Crookes dark space occupies half the length of the discharge tube when the pressure is 0.02mm of mercury. Estimate the pressure at which the dark space will fill the whole tube.

View Text Solution

4. Two discharge tubes have identical material structure and the same gas is filled in them. The

length of one tube is 10cm and that of th other tube is 20cm. Sparking starts in both the tubes when the potential difference between the cathode and the anode is 100V. If the pressure in the shorter tube is 1.0mm of mercury, what is the pressure in the longer tube?

Watch Video Solution

5. Calcuate n(T) / n(1000K) for tungsten emitter at T = 300K, 2000K and 3000K where n(T) represent the number of thermions emitted per secodn by the surface at temperature. T. Work function of tungsten is 4.52eV.

6. The saturation current from a thoriated-tungsten cathode at 2000K is 100mA. What will be the saturation current for a pure-tungsten cathode of the same surface area operating at the same temperature? The constant A in the Richardson-Dushman equation is $60 imes 10^4 Am^{-2} K^{-2}$ for pure tungsten and $3.0 imes 10^4 Am^{-2}K^{-2}$ for thoriated tungsten. The work function of pure tungsten is 4.5eV and that of thoriated tungsten is 2.6eV.

7. A Tungsten cathode and a thoriated-tungsten cathode have the same geometrical dimensions and are operated at the same temperature. The thoriatedtungsten cathode gives 5000 times more current than the other one. Find the operating temperature. Take relevant data from the previous problem.

Watch Video Solution

8. If the temperature of a tungsten filament is raised from $2000K \rightarrow 2010K$, by what factor does the emission current change? Work function of tungsten is 4.5eV.

9. The constant A in the Richardson-Dushman equation for tungsten is $60 imes 10^4 Am^{-2}$. The work function of tungsten is 4.5 eV. A tungsten cathode having a surface area $2.0 imes 10^{-5}m^2$ is heated by a 24W electric heater. In steady state, the heat radiated by the cathode equals the energy input by the heater and the temperature becomes constant. Assuming that the cathode radiates like a blackbody, calculate the saturation current due to thermions. Take Stefan constant $= 6 imes 10^{-8} Wm^{-2} K^{-4}$. Assume that the thermions take only a small fraction of the heat supplied.

10. A plate current of 10mA is obtained when 60 volts are applied across a diode tube. Assuming the Langmuir-Child equation $i_p \propto V_p^{\frac{3}{2}}$ to hold, find the dynamic resistance r_p in this operating condition.

·

Watch Video Solution

11. The plate current in a diode is 20mA when the plate voltage is 50V or 60V. What will be the current if the plate voltage is 70V?

12. The power delivered in the plate circuit of a diode is 1.0W when the plate voltage is 36V. Find the power delivered if the plate voltage is increased to 49V. Assume Langmuir-Child equation to hold`.

13. A triode value operates at $V_p = 225V$ and $V_g = -0.5V$. The plate current remains unchanged if the plate voltage is increased to 250V and the grid voltage is decreased to -2.5V. Calculate the amplification factor.

14. Calculate the amplification factor of a triode valve which has plate resistance of $2k\Omega$ and transconductance of 2 millimho`.

Watch Video Solution

15. The dynamic plate resistance of a triode value is $10k\Omega$. Find the change in the plate current if the plate voltage is changed from 200V to 220V.

16. Find the values of r_p , μ and g_m of a triode operating at plate voltage 200V and grid voltage -6V. The plate characteristic are shown in figure.

View Text Solution

much should the grid voltage be decreased in order

to bring the plate current back to its initial value?

18. The plate resistance and the amplification factor of a triode are $10k\Omega$ and 20. The tube is operated at plate voltage 250V and grid voltage -7.5V. The plate current is 10mA. (a) To what value should the grid voltage be changed so as to increase the plate current to 15mA? (b) To what value should the plate voltage be changed to take the plate current back to 10mA? **19.** The plate current, plate voltage and grid voltage of a 6F6 triode tube are related as

$$i_p = 41 ig(V_p + 7 V_gig)^{1.41}$$

where V_p and V_g are in volts and i_p in microamperes. The tube is operated at $V_p = 250V$, $V_g = -20V$. Calculate (a) the tube current, (b) the plate resistance, (c) the mutual conductance and (d) the amplification factor.

20. The plate current in a triode can be written as

$$i_p = k \Biggl(\Biggl(V_g + rac{V_p}{\mu} \Biggr)^{rac{3}{2}}.$$

Show that the mutual conductance is proportional to

the cube root of the plate current.

```
21. A triode has mutual conductance = 2.0 millimho
and plate resistance = 20k\Omega. It is desired to amplify
a signal by a factor of 30. What load resistance
should be added in the circuit?
```

22. The gain factor of an amplifier is increased from 10 to 12 as the load resistance is changed from $4k\Omega$ to $8k\Omega$. Calculate (a) the amplification factor and (b) the plate resistance.

Watch Video Solution

23. Figure shows two identical triode tubes connected in paralle. The anodes are connected together, the grids are connected together and the cathodes are connected together. Show that the equivalent plate resistance is half of the individual plate resistance, the equivalent mutual conductance is double the individual mutual conductance and the equivalent amplification factor is the same as the individual amplification factor.

Short Answer

1. An AC source is connected to a diode and a resistor

in series. Is the current through the resistor AC or

DC?

2. Would you prefer a material having a high melting point or a low melting point to be used as a cathode in a diode?

3. An isolated metal sphere is heated to a high temperature. Will it become positively charged due to thermionic emission?

4. A diode value is connected to a battery and a load resistance. The filament is heated so that a constant current is obtained in the circuit. As the cathode continuously emits electrons, does it get more and more positively charged?

Watch Video Solution

5. Why does thermionic emission not take place in

nonconductors?

6. The cathode of a diode valve is replaced by another cathode of double the surface area. Keeping the voltage and temperature conditions the same, will the plate current decrease, increase or remain the same?
