## BOOKS - HC VERMA PHYSICS (ENGLISH)

## MAGNETIC FIELD

## Example

1. A proton is projected with a speed of $3 X 10^{6} \mathrm{~ms}^{-1}$
horizontally from est to west. A uniform magnetic field $\vec{B}$ ofstren $>h 2.0 \times 10^{-3} \mathrm{~T}$ exists in the vertically upward direction(a) find the force on the
proton just after it is projected. (b) what is the acceleration produced?

## D Watch Video Solution

2. A particle having a charge of $100 \mu C$ and a mass of

10 mg is projected in a uniform magnetic field of 25 m
T with a speed of $10 \mathrm{~ms}^{-1}$. If the velocity is perpendicular to the magnetic field , how long will it take for the particle to come back to its original position for the first time after being projected.
3. figure shows a triangular loop $P Q R$ carrying a current i . The triangle is equilateral with edge-length
I. A uniform magnetic field $B$ exists in a direction parallel to PQ . Find the forces acting on the three wirs $P Q, Q R$ and $R P$ separately.

- Watch Video Solution

4. A current of 10.0 nA is established in a circular loop of radius 5.0 cm . find the magnetic dipole moment of the current loop. : The magnetic dipole moment is $\vec{\mu}=\vec{i} A$.

## - Watch Video Solution

5. A wire placed along north-south direction carries a current of 10 A from south to north. Find the magnetic field due to a 1 cm piece of wire at a point 200 cm north-east from the piece.
6. The two long, straight wires carrying electric currents in opposite directions. The separation between the wires is 5.0 cm . Find the magnetic field at a point P midway between the wires.

## - Watch Video Solution

7. The long, staight wires, each carrying an electric current of 5.0 A , are kept parallel to each other at a separation of 2.5 cm . Find the magnitude of the magnetic force experienced by 10 cm of a wire.
8. 

A circular
coil
of
radius
$1 \cdot 5$ cmcarriesacurrentof $1 \cdot 5 A$. If the coil has 25 turns, find the magnetic field at the centre.

## - Watch Video Solution

9. A long solenoid is formed by winding 20 turns
$\mathrm{cm}^{-1}$. What current is necessary to produce a magnetic field of 20 mT inside the solenoid?

## - Watch Video Solution

1. A charge of $2.0 \mu C$ moves with a speed of
$2.0 X 10^{6} \mathrm{~ms}^{-1}$ along the positive x -axis. A magnetic field $\vec{B}$ of strength $(0.20 \vec{J}+0.40 \vec{k}) T$ exists in space. Find the magnetic force acting on the charge

## D Watch Video Solution

2. A wire is bent in the form of an equilateral triangle PQR of side 10 cm and carries a current of 5.0 A. It is placed in a magnetic field $B$ of magnitude 2.0 T directed perpendicularly to the plane of the loop.

Find the forces on the three sides of the triangle.
3. Shows two long metal rails placed horizontally and parallel to each other at a separation i. A uniform magnetic field $b$ exists in the vertically downward direction. A wire of mass $m$ can slide on the rails. The rails are connected to a constant current source which drives a current $I$ in the circuirt. The friction coefficient between the rails and the wire is $\mu$. (a)

What should be the minimum value of $\mu$ which can prevent the wire from sliding on the rails?

Describe the motion of the wire if the value of $\mu$ is
half the value found in the previous part.

## - Watch Video Solution

4. A proton, a deuteron and $\alpha$-particle, whose kinetic energies are same, enter perpendicularly a uniform magnetic field. Compare the radii of their circular paths.
5. Singly charged magnesium $(A=24)$ ions are accelerated to kinetic energy $2 k e V$ and are projected perpendicularly into a magnetic field $B$ of magnitude 0.6 T . (a) Find the radius of the circle formed by the ions. (b) If there are also singly charged ions of the isotope magnesium. 26 , what would be the radius for these particles?

## - Watch Video Solution

6. A particle having a charge $20 \mu C$ and mass $20 \mu g$ moves along a circle of radius 5.0 cm under the action of a magnetic field $B=1.0 \mathrm{~T}$. When the particle is at a point P , a uniform electric field is switched on
and it is found that the particle continues on the tangent through P with a uniform velocity. Find the electric field.

## - Watch Video Solution

7. A particle of mass $m=1.6 X 10^{-27} \mathrm{~kg}$ and charge
$q=1.6 \times 10^{-19} \quad$ C moves at a speed of
$1.0 \mathrm{X} 10^{7} \mathrm{~ms}^{-7}$. It enters a region of uniform magnetic field at a point E , as shown in The field has
a strength of 1.0 T. (a) The magnetic field is directed into the plane of the paper. The particle leaves the region of the filed at the point F. Find the distance EF and the angle theta. (b) If the field is coming out of
the paper, find the time spent by the particle in the regio the magnetic feld after entering it at $E$.

## - Watch Video Solution

8. A beam of protons with a velocity of $4 X 10^{5} \mathrm{~ms}^{-1}$
enters a uniform magnetic field of 0.3 T. The velocity
makes an angle of $60^{\circ}$ with the magnetic field. Find the radius of the helical path taken by the proton beam.

## - Watch Video Solution

9. A rectangular coil of size $3.0 \mathrm{~cm} \times 4.0 \mathrm{~cm}$ and having 100 turns, is pivoted about the $z$-axis as
shown in figure the colil carries an electric current of
2.0 A and a magnetic field of 1.0 T is present along
the $y$-axis. Find the torque acting on the coil if the side in the $x-y$ plane makes an angle $\theta=37^{\circ}$ with
the x -axis.

## - Watch Video Solution

10. An electron moves with a constant speed v along
a circle of radius r.(a) find the equivalent current through a point on its path.(b) Find the magnetic moment of the circulating electron.(c ) Find the ratio
of the magnetic moment to the angular momentum of the electron.

## - Watch Video Solution

11. An electron is released from the origin at a place
where a uniform electric field E and a uniform magnetic field $B$ exist along the negative $y$-axis and the nagative $z$-axis respectively. Find the displacement of the electron along the $y$-axis when its velocitybecomes perpendicular to the electric feld
for the first time.

## D View Text Solution

12. Two long wires $a$ and $b$, carrying equal currents of $10 * \mathrm{OA}$, are placed parallel to each other with a separation of $4 * 00 \mathrm{~cm}$ between them as shown in figure. Find the magnetic field $B$ at each of the points
$P, Q$ and $R$.

## - Watch Video Solution

13. Two parallel wires $P$ and $Q$ placed at a separation
$d=6 \mathrm{~cm}$ carry electric currents $\mathrm{i}_{-} 1=5 \mathrm{~A}$ and $\mathrm{i}_{-} 2=2 \mathrm{~A}$ in opposite directions as shown in figure. Find the point on the line PQ where the resultant magnetic field ` is zero.

(a)

(b)
14. Two long, straight wires a and b are $2 \cdot 0 \mathrm{~m}$ apart, perpendicular to the plane of the paper as shown in figure
. The wire a carries a current of $9 \cdot 6 \mathrm{~A}$ directed into the plane of the figure, The magnetic field at the point $P$ at a distance of $10 / 11 \mathrm{~m}$ from the wire $b$ is zero.

Find (a) the magnitude and direction of the current in b,
(b) the magnitude of the magnetic field $B$ at the points
and (c) the force per unit length on the wire b:

- View Text Solution

15. A current of $2 \cdot 00 A$ exists in a square loop of edge $10 \cdot 0 \mathrm{~cm}$. Find the magnetic field B at the centre of the square loop.

## - Watch Video Solution

16. Figure shows a square loop made from a uniform
wire. Find the magnetic field at the centre of the
square
if a battery is connected between the points A and C .

## - Watch Video Solution

17. Two long wires, carrying currents $i_{1}$ and $i_{2}$, are placed perpendicular to each other in such a way that they just avoid a contact. Find the magnetic
force on a small length dl of the second wire situated at a distance I from the first wire. (figure)

## - Watch Video Solution

18. Figure shows a part of an electric circuit. $A B C D$ is
a rectangular loop made of uniform wire. The length
$A D=B C=1 \mathrm{~cm}$. The sides $A B$ and $D C$ are long as
compared to the other two sides. Find the magnetic force per unit length acting on the wire DC due to the wire $A B$ if the ammeter reads 10A.

## - Watch Video Solution

19. Figure shows a current loop having two circular arcs joined by two radial lines. Find the magnetic
field $B$ at the centre $O$.

## - Watch Video Solution

20. Find the magnetic field at the point $P$ in figure.

The curved portion is a semicircle and the straight
wires are long.

## - Watch Video Solution

21. The magnetic field $B$ due to a current- carrying
circular loop of radius 12 cm at its center is
$0.50 \times\left(10^{-4}\right) T$. Find the magnetic field due to this
loop at a point on the axis at a distance of 5.0 cm from the centre.
22. Consider a coaxial cable which consists of an inner wire of radius a surrounded by an outer shell of inner and outer radii $b$ and $c$ respectively. The inner wire carries an electric current (i_0) and the outer shell carries an equal current in opposite direction. Find the magnetic field at a distance $x$ from the axis where (a) xlta, (b) altxltb, (c) bltxItc and (d)xgtc. Assume that the current density is uniform in the inner wire and also uniform in the outer shell.

23. Figure shows a cross section of a large metal.

Sheet carrying an electric current along its surface.
The current in a strip of width dl is Kdl where K is a constant. Find the magnetic field at a point $P$ at a distance x from the metal sheet.
$\cdot P$
$\odot \odot \odot \odot \odot \odot \odot \odot \odot{ }^{\times}$
24. Consider the situation described in the previous
example. A particle of mass $m$ having a charge $q$ is placed at a distance $d$ from the metal sheet and is projected towards it. Find the maximum velocity of projection for which the particle does not hit the sheet.

## - Watch Video Solution

25. Three identical long solenoids $P, Q$ and $R$ are connected to each other as shown in figure. If the magnetic field at the centre of $P$ is 2.0 T , what would be the field at the centre of Q ? Assume that the field
due to any solenoid is confined within the volume of that solenoid only.

## - Watch Video Solution

26. A long, straight wire carries a current i. A particle having a positive charge q and mass m , kept at a distance x_0 from the wire is projected towards it with a speed v. Find the minimum separation
between the wire and the particle.

R

## D View Text Solution

## Objective 1

1. A positively charged particle projected towards east is deflected towards north by a magnetic field.

The field may be
A. towards west
B. towards south
C. upward
D. downward

## Answer: downward

## D Watch Video Solution

2. A charged particle is whirled in a horizontal circle on a frictionless table by attaching it to a string fixed at one pint. If a magnetic field is switched on in the vertical direction, the tension in the string
A. will increase
B. will decrease
C. will remai the same
D. may increase or decrease

## Answer: may increasec or decrease

## - Watch Video Solution

3. Which of the following particles will describe wll experience maximum magnetic force(magnitude)
when projected with the same velocity perpendicular to a magnetic field?
A. Electron
B. Proton
C. $\mathrm{He}^{+}$

D. $\mathrm{Li}^{++}$

## Answer: $\mathrm{Li}^{++}$

## - Watch Video Solution

4. Which of the following particles will describe the smallest circle when projected with the same velocity perpendicular to a magnetic field?
A. Electron
B. Proton
C. $\mathrm{He}^{+}$

D. $\mathrm{Li}^{++}$

## Answer: Electron

## - Watch Video Solution

5. Which of the follwing particles will have minimum frequency of revolution when projected with the same velocity perpendicular to a magnetic field?
A. Electron
B. Proton
C. $\mathrm{He}^{+}$

D. $\mathrm{Li}^{++}$

## Answer: $\mathrm{Li}^{++}$

## - Watch Video Solution

6. A circular loop of area $1 \mathrm{~cm}^{2}$, carrying a current of

10 A , is placed in a magnetic field of 0.1 T perpendicular to the plane of the loop. The torque on the loop due to the magnetic field is
A. Zero
B. $10^{-4} \mathrm{Nm}$
C. $10^{-2} \mathrm{Nm}$
D. 1 N m

## Answer: zero

## - Watch Video Solution

7. A beam consisting of protons and electrons moving at the same speed goes through athin region in which there is a magnetic field
perpendicular to the beam. Protons and the electrons

## - Watch Video Solution

8. A charged particle moves in a uniform magnetic
field. The velocity of the particle at some instant makes an acute angle with the magnetic field. The path of the particle will be
A. a straight line
B. a circle
C. a helix with uniform pitch

## D. a helix with nonuniform pitch

## Answer: a helix with uniform pitch

## D Watch Video Solution

9. A particle moves in a region having a uniform magnetic field and a parallel, uniform electric field. At some instant, the velocity of the particle is perpendicular to the field direction. The path of the particle will be
A. a straight line
B. a circle
C. a helix with uniform pitch

## D. a helix with nonuniform pitch

## Answer: a helix with nonuniform pitch

## - Watch Video Solution

10. An electric current I enters and leaves a uniform circular wire of radius a through diametrically opposite points. A charged paricle q moving along the axis of the circular wire passes through its centre at speed v . The magnetic force acting on the particle when it passes through the centre has a magnitude

> A. $q v \frac{\mu_{0} i}{2 a}$
> B. $q v \frac{\mu_{0} i}{2 \pi a}$
> C. $q v \frac{\mu_{0} i}{a}$
> D. zero

## Answer: zero

## - Watch Video Solution

## Exercises

1. An alpha particle is projected vertically upward a speed of $3.0 X 10^{4} \mathrm{kms}^{-1}$ in a region where a
magnetic field of magnitude 1.0 T exists in the direction south to north. Find the magnetic force that acts on the a particle.

## - Watch Video Solution

2. An electron is projectd horizontally with a kinetic energy of 10 keV . A magnetic feld of strength
$1.0 \mathrm{X} 10^{-7} \mathrm{~T}$ exists in the vertically upward direction.
(a)will the electron deflect towards right or towards
left of its motion? (b) calculate the sideways deflection of the electrion in travelling through 1m. make appropriate approximations.
3. A magnetic field of $\left(4.0 \times 10^{-3} \vec{k}\right)$ T exerts a force of $\left(4.0 \vec{i}+3.0 \vec{j} x 10^{-10} \mathrm{~N}\right.$ on a particle having a charge of $1.0 \times 10^{-9} \mathrm{C}$ and going in the $\mathrm{x}-\mathrm{y}$ plane. Find the velocity of the particle.

## - Watch Video Solution

4. An experimenter's diary reads as follows: "a charged particle is projected in a magnetic feld of $(7.0 \vec{i}-3.0 \vec{j}) X 10^{-3} \mathrm{~T}$. The acceleraation of the
particle is
found
to
be
$(\square \vec{i}+7.0 \vec{j}) X 10^{-6} m s^{-2}$. The 1 mber $\rightarrow \leq$ ftof
veci' in the last expression was not readable. What can this number be?

## - Watch Video Solution

5. A 10 g bullet having a charge of $4.00 \mu \mathrm{C}$ is fired at a speed of $270 \mathrm{~ms}^{-1}$ in a horizontal direction. A vertical magnetic field of $500 \mu T$ exists in the space.

Find the deflection of the bullet due to the magnetic
field as it travels through 100 m . make appropriate approximations.
6. when a proton is released from rest in a room, it
starts with an initial acceleration $a_{0}$ towards west.
When it is projected towards north with a speed $v_{0}$,
it moves with an initial acceleration $3 a_{0}$ towards
west. Find the elecrtic field and the minimum possible magnetic field in the room.

## - Watch Video Solution

7. Consider a 10 cm long protion of a straight wire carrying a current of 10 A placed in a magnetic field of 0.1 T making an angle of $53^{\circ}$ with the wire. What magnetic force does the wire experience?

## - Watch Video Solution

8. A current of 2 A enters at the corner d of a square frame abcd of side 20 cm and leaves at the opposite corner b . A magnetic field $\mathrm{B}=0.1 \mathrm{~T}$ exists in the space in a direction perpenducular to the plane of the frame as shown in Find the magnitude and direction of the magnetic forces on the four sides of the frame.

9. A magnetic field of strength 1.0 T is produced by a strong electromagnet in a cylindrical region of radius 4.0 cm as shown in. A wire, carrying a current of 2.0 A , is placed perpendiuclar to and intersecting the axis of the cylindreical region. Find the
magnitude of the force acting on the wire.

## - Watch Video Solution

10. A wire of length I carries a current I along the $x$ asis. A magnetic field exists which is given as
$\vec{B}=B_{0}(\vec{i}+\vec{j}+\vec{k})$ T. find the magnitude of the magnetic force acting on the wire.

## - Watch Video Solution

11. A current of 5.0 A exists in the circuit shown in

The wire PQ has a length of 50 cm the magnetic field in which it is immersed has a magnitude of 0.20 T .

Find the magnetic force acting on the wire PQ .

## - Watch Video Solution

12. A circular loop of radius a, carrying a current I , is placed in a tow dimensional magnetic field. The centre of the loop coincides with the centre of the filed The strenght of the magnetic field at the
pariphery of the loop is $B$. find the magnetic force on the wire.

D Watch Video Solution
13. A hypthetical magnetic field existing in a region is given by $\vec{B}=B_{0} \vec{e}_{r}$, where $\overrightarrow{ } r$ denotes the uit vector along the redial direction. A circular loop of radus a, carrying a current I , is placed with its plane parallel to the $x-y$ plane and the centre at $(0,0, d)$
.Find the magnitude of the magnetic force acting on the loop.

## - Watch Video Solution

14. A rectangular wire-loop of width a is suspended
from the insulated pan of a spring blance as shown
in A current I exists in the anticlockwise direction in
the loop. A magnetic field B exists in the lower region.Find the change in the tension of the spring if the current in the loop is reversed.

## Watch Video Solution

15. A current loop of arbitrary shape lies in a uniform magnetic field $B$. show that the net magnetic force acting on the loop is zero.

## - Watch Video Solution

16. Prove that the force acting on a current carrying
wire, joining two fixed points $a$ and $b$ in a uniform magnetic field, is independent of the shape of the wire.
17. A semicircular wire of radius 5.0 cm carries a current of 5.0 A . A magnetic field B of magnitude 0.50

T exists along the perpendicular to the plane of the wire. Find the magnitude of the magnetic force acting on the wire.

## - Watch Video Solution

18. A wire, carrying a current $i$, is kept in the $x-y$ plane along the curve $y=A \sin \left(\frac{2 \pi}{\lambda} x\right)$. A magnetic
field $B$ exists in the $z$-direction. Find the magnitude of the magnetic force on the portion of the wire between $x=0$ and $x=\lambda$.

## - Watch Video Solution

19. A rigid wire consists of a semicircular portion of radius $R$ and two straight sections the wire is partially immersed in a perpendicualr magnetic field $B$ as shown in the figure. Find the magnetic force on the wire if it carries a current $i$.

| $\times$ | $\times$ | $\times$ | $\times$ | $\times$ | $\times$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\times$ | $\times$ | $x$ | $R^{x}$ |  | $\times$ |
| $\times$ | $\times$ | $\times$ | $\times$ | $\times$ | $\times$ |
| $\times$ | $\times$ |  | $\times$ | $x$ | $\times$ |

20. A straight horizontal wire of mass 10 mg and length 1.0 cm carries a current of 2.0 A . what minimum megnetic field $B$ should be applied in the region so that the magnetic force on the wire may balance its weight?

## - Watch Video Solution

21. Two metal strips, each of length, each of length I,
are clamped parallel to each other on a horizontal
floor with a separation b between them. A wire of mass $m$ line on them perpendicularly as shown in
figure. A vertically upward magnetic field of strenght

B exists in the space. The matal strips are smooth but the cofficient of freiction between the wire and the floor is $\mu$. A current i is established when the switch S is closed at the instant $t=0$. Discuss the motion of the wire after the switch is closed. How far away from the strips will the wire reach?

## - Watch Video Solution

22. A matel wire $P Q$ of mass 10 g lies at rest on two horizontal metal rails separated by 4.90 cm . A vertically downward magnetic field of magnitude 0.800 T exists in the space. The resistance of the circuit is slowly decreased and it is found that when the resistance goes below $20.0 \Omega$, the wire PQ starts sliding on the rails. Find the coefficient of friction.

## - Watch Video Solution

23. A straight wire of length I can slide on two parallel plastic rails kept in a horizontal plane with a separation d. The coefficient of friction between the wire and the rails is $\mu$. If the wire carries a current I, what minimum magnetic field should exist in the space in order to slide the wire on the rails.

## - Watch Video Solution

24. A circular loop of radius a, carrying a current I , is placed in a tow dimensional magnetic field. The centre of the loop coincides with the centre of the
filed The strenght of the magnetic field at the
pariphery of the loop is $B$. find the magnetic force on the wire.

D Watch Video Solution
25. A ring of radius 0.1 m is made out of thin metallic wire of area of cross section $10^{-6} \mathrm{~m}^{2}$. The ring has a uniform charge of $\pi$ coulombs. Find the change in the radius of the rig when a charge of $10^{-8} \mathrm{C}$ is placed at the center of the ring. Young's modulus of the metal is $2 \times 10^{11} \mathrm{Nm}^{-2}$.

## - Watch Video Solution

26. The magnetic field existing in a region is given by $\vec{B}=B_{0}\left(1+\frac{x}{l}\right) \vec{k}$. A square loop of edge I and carrying a current I , is placed with its edges parallel
to the $x-y$ axes. Find the magnitude of the net magnetic force experienced by the loop.

## - Watch Video Solution

27. A conducting wire of length I, lying normal to a magnetic field $B$, moves with a velocity $v$ as shown in
(a) Find the average magnetic fore on a free electron
of the wire. Due to this magnetic force, electrons
concentrate at one end resulting in an electric field
inside the wire. The redistribution stops when the
electric force on the free electrons balances
themagnetic force. Find the electric field developed
inside the wire when the redistribution field
developed inside the wire when the redistribution stops. (c) what potential difference is developed between the ends of the wire?

$$
\begin{aligned}
& \begin{array}{l}
x \\
\times
\end{array}
\end{aligned}
$$

## - Watch Video Solution

28. A currrent I is passed through a silver strip of width $d$ and area of cross section $A$. The number of free electrons per unit volume is $n$. (a) Find the drift velocity $v$ of the electrons. (b) If a magnetic field $B$
exists in the region as shown in what is the average magnetic force on the free electrons? (c) Due to the magnetic force, the free electrons get accumulated on one side of the conductor along its length. This produces a transverse electric field in the conductor which opposes the magnetic force on the electrons.

Find the magnitude of the electric field which will be the potential diference developed across the width of the conductor due to the electron- accumulation?

The appearance of a transverse emf, when a current-
carrying wire is placed in a magnetic field, is called
hall effect.

## D Watch Video Solution

29. A particle having a charge of $2.0 X 10^{-8} C$ and a mass of $2.0 \times 10^{-10} g$ is projected with a speed of $2.0 X 10^{3} \mathrm{~ms}^{-1}$ in a region having a uniform magnetic field of 0.10 T . The velocity is perpendicular to the field. Find the radius of the circle formed by the particle and also the time period.

## - Watch Video Solution

30. A proton describes a circle of radius 1 cm in a magnetic field of strength 0.10 T . What would be the radius of the circle described by an a-particle moivng with the same speed in the same magnetic field?

## - Watch Video Solution

31. An electron having a kinetic energy of 100 eV
circulates in a path of radius 10 cm in a magnetic
field. Find the magnetic field and the number of revolutons per second made by the electron.

## - Watch Video Solution

32. Protons having kinetic energy $K$ emerge from an accelerator as a narrow beam. The beam is bent by a perpendicular magnetic field so that it just misses a plane target kept at a distance I in front of the accelerator. Find the magnetic field.

## - Watch Video Solution

33. A charged particle is accelerated thrught a potential difference of 12 kV and acquires a speed of
$1.0 \times 10^{6} \mathrm{~ms}^{-1}$. It is then injected perpendiuclarly
into a magnetic field of strenght 0.2 T. find the radius of the circle described by it.

## D Watch Video Solution

34. Doubly ionized helium ions are projected with a speed of $10 \mathrm{kms}^{-1}$ in a direction perpendicular to a uniformmagnetic field of magnitude 1.0 T . Find (a) the force acting on an ion, (b) the radius of the circle in which it ciruclates and (c) the time taken by an ion to complete the circle.
35. A proton is projected with a velocity of $3 X 10^{6} \mathrm{~ms}^{-1}$ perpendicular to a uniform magnetic field of 0.6 T. find the acceleration of the proton.

## - Watch Video Solution

36. (a) An electron moves along a circle of radius $1 m$ in a perpendicular magnetic field of strength 0.50 T .

What would be its speed? Is it reasonable?(b) If a proton moves along a circle of the same radius in the same magnetic field, what would be its speed?
37. A particle of mass $m$ and positive charge $q$, moving with a uniform velocity v, enters a magnetic field $B$ as shown in (a) Find The radius of the circular arc it describes in the magnetic field. (b) find the angle subtended by the arc at the center. (c ) How long does the particle stay inside the magnetic field?
(d) Solve the three parts of the above problem if the charge $q$ on the particle is negative.

$\times \quad \times \quad \times \quad \times$
$x \quad x \quad x \quad x$
38. A charged particle $(q, m)$ enters perpendicular in a uniform magnetic field $B$ and comes out field as shown. Find the angle of deviation $\theta$ for particle to cross magnetic field will be

39. A narrow beam of singley charged carbon ions, moving at a constant velocity of $6.0 X 10^{4} \mathrm{~ms}^{-1}$, is
sent perpendicularly in a rectangular region having
uniform magnetic field $\mathrm{B}=0.5 \mathrm{~T}$. It is found that two
beams emerge from the field in the backward derection, the separations from the incident beam being 3.0 cm and 3.5 cm . Identify the isotopes persent in the ion beam. Take the mass of an ion =
$A\left(1.6 \times 10^{-27} \mathrm{~kg}\right.$, where A is the mass number.

## - Watch Video Solution

40. $\mathrm{Fe}^{\wedge}+$ ions are accelerated through a potential
difference of 500 V and are injected normally into a homogeneous magnetic field B of strength 20.0 m T .

Find the radius of the circular paths followed by the isotopes with mass numbers 57 and 58 . Take the
mass of an ion $=A\left(1.6 X 10^{-27} \mathrm{~kg}\right.$ where A is the mass number.

## - Watch Video Solution

41. A narrow beam of singly charged potassium ions
of kinetic energy 32 keV is injected into a region of
width 1.00 cm having a magnetic field of strength
0.500 T as shown in. The ions are collected at a
screen 95.5 cm away from the field region. If the beam
contains isotopes of atomic weights 39 and 41, find
the separation between the points where these isotopes strike the screen. Take the mass of a potassium ion $=A\left(1.6 X 10^{-27}\right) \mathrm{kg}$ where A is the
mass number.

## D View Text Solution

42. Shows a convex lens of focal length 12 cm lying in a uniform magnetic field B of magnitude 1.2 T parallel to its principal axis. A particle having a charge $2.0 \times 10^{-3} \mathrm{C}$ and mass $2.0 \times 10^{-5} \mathrm{~kg}$ is projected perpendiucular to the plane of the diagram with a
speed of $4.8 \mathrm{~ms}^{-1}$. The particle moves along a circle with its centre on the principal axis at a distance of 18 cm from the lens. Show that the image of the particle goes along a circle end find the radius of thet circle.

## D View Text Solution

43. Electrons emitted with negligible speed from an electron gun are accelerated through a potential
difference $V$ along the $x$-axis. These electrons emerge from a narrow hole into a uniform magnetic field $B$ directed along this axis. However. Some of the electrons emerging from the hole make slightly divergent angles as shown in fig., show that these paraxial electrons are refocused on the $x$-axis at a distance $\frac{\sqrt{8 \pi^{2} m V}}{e B^{2}}$.

## - View Text Solution

44. Two particles, each having a mass $m$ are placed at
a separation $d$ in a uniform magnetic field $B$ as
shown in they have opposite charges of equal magnitude $q$. at time $t=0$, the particles are projectd towards each other,each with a speed v. suppose the
coulomb force between the charges is switched off.
(a) Find the maximum value $v_{m}$ of the projection
speed so that the two particles do not collide. (b)
What would be the minimum and maximum
separation between the particles if $v=\frac{v_{m}}{2}$ ? (c) At
what instant will a collision occur between the
particles if $v=2 v_{m}$ ? (d) Suppose $v=2 v_{m}$ and the
collision between the particles is completely
inelastic. Describe the motion after the collision.

## - Watch Video Solution

45. A uniform magnetic field of magnitude 0.20 T exists in space from east to west what speed should a particle of mass 0.010 g and having a charge $1.0 \times 10^{-5} C$ be projected from south to north so that it moves with a uniform velocity?
46. A particle moves in a circle of diamater 1.0 cm under the action of magnetic field of 0.40 T , An electric field of $200 \mathrm{Vm}^{-1}$ makes the path straight.

Find the charges/mass ratio of the particle.

## - Watch Video Solution

47. A proton goes undflected in a crossed and magnetic field (the fields are perpendicular to each other) at a speed of $2.0 \times 10^{5} \mathrm{~ms}^{-1}$. The velocity is perpendicular to both the fields. When the electric field is switched off, the proton moves along a circle
of radius 4.0 cm . Find the magnitudes of the electric and the magnetic fields. take the mass of the proton $=1.6 \times 10^{-27} \mathrm{~kg}$.

## - Watch Video Solution

48. A particle having a charge of $5.0 \mu C$ and a mass of $5.0 \times 10^{-12} \mathrm{~kg}$ is projected with a speed of
$1.0 \mathrm{kms}^{-1}$ in a magnetic field of a magnetic field of magnitude 5.0 m T . The angle between the magnetic field and the velocity is $\sin ^{-1}(0.90)$. show that the path of the particle will be a helix. Find the diameter of the helix and its pitch.
49. A proton projected in a magnetic field of 0.020 T travels along a helical path of radius 5.0 cm and pitch 20 cm . Find the components of the velocity of the proton along and perpendicular to the magnetic field. Take the mass of the proton $=1.6 \times 10^{-27} \mathrm{~kg}$.

## - Watch Video Solution

50. A particle having mass $m$ and charge $q$ is released
from the origin in a region in which electric field and magnetic field are given by

$$
\vec{B}=-B_{0} \vec{J} \text { and } \vec{E}-E_{0} \vec{K}
$$

Find the speed of the particle as a function of its zcoordinate.

## - Watch Video Solution

51. An electron is emitted with negligible speed from th nagative plate of a parallel plate capacitor charged ot a potential difference V . The separtion between the plates is $d$ and a magnetic field $B$ exists in the space as shown in. Show that the electron will
fail to strike the upper plate if Itdgt $\left(\frac{2 m_{e} V}{e B_{0}^{2}}\right)^{\frac{1}{2}}$.

## - Watch Video Solution

52. A rectangular coil of 100 turns has length 5 cm and width 4 cm . it is placed with its plane parallel to a uniform magnetic field and a current of 2 A is sent through the coil. Find the magnitude of the magnetic field $B$, if the torque acting on the coil is $0.2 \mathrm{Nm}^{-1}$.

## - Watch Video Solution

53. A 50 turn circular coil of radius 2.0 cm carrying a current of 5.0 A is rotated in a magnetic field of strength 0.20 T . (a) What is the maximum torque that acts on the coil? (b) in a particular position of the coil, the torque acting on it is half of this maximum. What is the angle between the magnetic field and the plane of the coil?
54. A rectangular loop of sides 20 cm and 10 cm carries a current of 5.0 A. A uniform magnetic field of magnituded 0.20 T exists parallel ot the longer side of the loop (a) What is the force acting on the loop?
(b) what is the torque acting on the loop?

## - Watch Video Solution

55. A circular coil of radius 2.0 cm has 500 turns in it
and carries a current of 1.0 A . Its axis makes an angel
of $30^{\circ}$ with the uniform magnetic field of of magnitude 0.40 T that exists in the space. Find the torque acting on the total.

## - Watch Video Solution

56. A circular loop carrting a current a current I has wire of total length L. A uniform umagnetic field B exists parallel to the plane of the loop. (a ) find the trouque on the loop.(b) If the sme length of the wire is used to form a squar loop, what would be the torque? Which is larger?

## - Watch Video Solution

57. A square coil of edge I having n turns carries a curent i . it is kept on a smooth horizontal plate. A
uniform magnetic field $B$ exists in a direction parallel to an edge the total mass of the coil is M . What should be the minimum value of $B$ for which the coil will start tipping over?

## - Watch Video Solution

58. consider a nonconducting ring of radius $r$ and mass m which has a total charge q distributed uniformly on it the ring is rotated about its axis with an angular speed $\omega$. (a) Find the equivalent electric current in the ring (b) find the magnetic moment $\mu$ of the . (c) show that $\mu=\frac{q}{2 m}$ where I is the angular momentum of the ring about its axis of rotation.

## - Watch Video Solution

59. Consider a non conducting plate of radius $a$ and mass $m$ which has a charge $q$ distributed uniformly over it, The plate is rotated about its own axis with a angular speed $\omega$. Show that the magnetic moment
$M$ and the angular momentum $L$ of the plate are related as $\frac{M}{L}=\frac{q}{2 m}$.

## - Watch Video Solution

60. Consider a non conducting plate of radius $a$ and mass $m$ which has a charge $q$ distributed uniformly
over it, The plate is rotated about its own axis with a angular speed $\omega$. Show that the magnetic moment
$M$ and the angular momentum $L$ of the plate are
related as $\frac{M}{L}=\frac{q}{2 m}$.

## - Watch Video Solution

## Objective 1

1. A vertical wire carries a current in upward direction. An electron beam sent horizontally towards the wire will be deflected
A. towards right
B. towards left

## C. upwards

D. downwards

## Answer: C

## - Watch Video Solution

2. A current- carrying straight wire is kept along the axis of a circular loop carrying a current. The straight wire
A. will exert an inward force on the circular loop
B. will exert an outward force on the circular loop
C. will not exert any force on the circular loop
D. will exert a force on the circular loop parallel to itself.

## Answer: C

## - Watch Video Solution

3. A proton beam is going from north to south and an electron beam is going from south to north.

Neglecting the earth's magnetic field, the electron beam will be deflected
A. towards the proton beam
B. away from the proton beam
C. upwards
D. downwards

## Answer: A

## - Watch Video Solution

4. A circular loop is kept in that vertical plane which
contains the north- south direction. It carries a current that is towards north at the topmost point.

Let $A$ be a point on the axis of the circle to the east
of it and $B$ a point on this axis to the west of it. The magnetic field due to the loop.
A. is towards east at $A$ and towards west at $B$
B. is towards west at A and towards east at B
$C$. is towards east at both $A$ and $B$
D. is towards west at both $A$ and $B$.

## Answer: D

## - Watch Video Solution

5. Consider the situation shown in figure. The straight wire is fixed but the loop can move under
magnetic force. The loop will

A. remain stationary
B. move towards the wire
C. move away form the wire
D. rotate about the wire.

## Answer: B

## - Watch Video Solution

6. A charged particle is moved along a magnetic field
line. The magnetic force on the particle is
A. along its velocity
B. opposite to its velocity
C. perpendicular to its velocity
D. zero.
7. A moving charge produces
A. electric field only
B. magnetic field only
C. both of them
D. none of them.

Answer: C

- Watch Video Solution

8. A particle is projected in a plane perpendicular to
a uniform magnetic field. The area bounded by the
path described by the particle is proportional to
A. the velocity
B. the momentum
C. the kinetic energy
D. none of them.

Answer: C

- Watch Video Solution

9. Two particle X and Y having equal charge, after being accelerated through the same potential difference enter a region of uniform magnetic field and describe circular paths of radii $R_{1}$ and $R_{2}$ respectively. The ratio of the mass of $X$ to that of $Y$ is
A. $\left(\frac{\left(\frac{R_{1}}{R_{2}}\right)^{1}}{2}\right)$
B. $\frac{R_{1}}{R_{2}}$
C. $\left(\frac{R_{1}}{R_{2}}\right)^{2}$
D. $\left(R_{1}\right)\left(R_{2}\right)$

Answer: C
10. Two parallel wires carry currents of 20 A and 40 A
in opposite directions. Another wire carrying a current antiparallel to 20A is placed midway between the two wires. The magnetic force on it will be
A. towards 20 A
B. towards 40 A
C. zero
D. perpendicular to the plane of the currents .

Answer: B
11. Two parallel, long wires carry currents $i_{1}$ and $i_{2}$ with $i_{1}>i_{2}$. When the currents are in the same direction, the magnetic field at a point midway between the wires is 10 mu T . If the direction of $i_{2}$ is reversed, the field becomes 30 mu T. The ration $\frac{i_{1}}{i_{2}}$ is
A. 4
B. 3
C. 2
D. 1

## - Watch Video Solution

12. Consider a long, straight wire of cross-sectional area A carrying a current i. Let there be n free electrons per unit volume. An observed places himself on a trolley moving in the direction opposite to the current with a moving in the direction opposite to the current with a speed ${ }^{`}(v=i / n A e)$ and separated from the wire by a distance r. The magnetic field seen by the observer is very nearly
A. $\frac{\mu_{0} i}{2 \pi r}$
B. zero
C. $\frac{\mu_{0} i}{\pi r}$
D. $\frac{\left(2 \mu_{0}\right) i}{\pi r}$

## Answer: A

## - Watch Video Solution

## Objective 2

1. The magnetic field at the origin due to a current
element I $(\vec{d} l)$ placedataposi $\rightarrow n(\vec{r}) i s$
A. $\left(\left(\frac{\mu_{0} i}{4 \pi}\right) \frac{\overrightarrow{d l} \times \vec{r}}{r^{3}}\right)$
B. $\left(-\left(\left(\mu_{0}\right) \frac{i}{4 \pi}\left(\vec{r} \times \frac{\overrightarrow{d l}}{r^{3}}\right)\right)\right)$
C. $\left(\left(\mu_{0}\right) \frac{i}{4 \pi}\left(\vec{r} \times \frac{\overrightarrow{d l}}{r^{3}}\right)\right)$
D. $\left(-\left(\left(\mu_{0}\right) \frac{i}{4 \pi} \frac{\overrightarrow{d l} \times \vec{r}}{r^{3}}\right)\right)$

## Answer: C::D

## - Watch Video Solution

2. Consider three quantities ( $x=E / B, y=$ (sqrt(1/((mu_0)(epsilon_0)))) and $z=(1 / C R)$ '. Here, I is the length of a wire, C is a capacitance and R is a
resistance. All other symbols have standard meanings.
A. $x, y$ have the same dimensions.
B. $y, z$ have the same dimensions.
C. $z, x$ have the same dimensions.
D. none of the three pairs have the same dimensions.

Answer: A::B::C

- Watch Video Solution

3. A long, straight wire carries a current along the $z$ axis. One can find two points in the $x-y$ plane such that
A. the magnetic fields are equal
B. the directions of the magnetic fields are the

## same

C. the magnitudes of the magnetic fields are
equal
D. the field at one point is opposite to that at the
other point.
4. A long, straight wire of radius $R$ carries a current distributed uniformly over its cross section. The magnitude of the magnetic field is
A. maximum at the axis of the wire
B. minimum at the axis of the wire
C. maximum at the surface of the wire
D. minimum at the surface of the wire.

## Answer: B::C

- Watch Video Solution

5. A hollow tube is carrying an electric current along its length distributed uniformly over its surface. The magnetic field
A. increase linearly from the axis to the surface.
B. is constant inside the tube
C. is zero at the axis
D. is zero just outside the tude.

## Answer: B::C

6. In a coaxial, straight cable, the central conductor and the outer conductor carry equal currents in opposite directions. The magnetic field is zero.
A. outside the cable
B. inside the inner conductor
C. inside the outer conductor
D. in between the two conductor

## Answer: A

7. A steady electric current is flowing through a cylindrical conductor. Then,
A. The electric field at the axis of the conductor is zero.
B. The magnetic field at the axis of the conductor
is zero.
C. The electric field in the vicinity of the conductor is zero.
D. The magnetic field in the vicinity of the conductor is zero.

## Answer: B::C

## - Watch Video Solution

## Exercise

1. Using the formulae
$(\vec{F})=(\vec{q} v) \times(\vec{B})$ and $B=\left(\mu_{0}\right) \frac{i}{2 \pi r}$,find
the SI units of the magnetic field B and the
permeability constant

## - Watch Video Solution

2. A current of 10A is established in a long wire along the positive $z$-axis. Find the magnetic field (vec B) at the point ( $1 \mathrm{~m}, 0,0$ ).

## - Watch Video Solution

3. A copper wire of diameter 1.6 mm carries a current of 20A. Find the maximum magnitude of the magnetic field (vec $B$ )due to this current.
4. A transmission wire carries a current of 100 A .

What would be the magnetic field $B$ at a point on the road if the wire is 8 m above the road?

## - Watch Video Solution

5. A long, straight wire carrying a current of 1.0 A is placed horizontally in a uniform magnetic field $B=($ $1.0 \times 10^{-5}$ ) T pointing vertically upward. Find the magnitude of the resultant magnetic field at the points $P$ and $Q$, both situated at a distance of 2.0 cm
from the wire in the same horizontal plane.

## P.

## Q• B@

## D Watch Video Solution

6. A long, straight wire of radius $r$ carries a current $i$ and is placed horizontally in a uniform magnetic field B pointing vertically upward. The current is uniformly distributed over its cross section. (a) At what points
will the resultantant magnetic field have maximum magnitude? What will be the maximum magnitude?
(b) What will be the minimum magnitude of the resultant magnetic field?

## - Watch Video Solution

7. A long, vertical straight wire carrying a current of 30 A is placed in an external, uniform magnetic field of $\left(4.0 \times\left(10^{-4}\right) \mathrm{T}\right.$ exists from south to north. Find magnetic field at a point 2.0 away from the wire.

## - Watch Video Solution

8. A long vertical wire carrying a current of 10A in the upward direction is placed in a region where a horizontal magnetic field of magnitude $\left(2.0 \times 10^{-3}\right)$

T exists from south to north. Find the point where the resultant magnetic field is zero.

## - Watch Video Solution

9. Figure shows two parallel wires separated by a distance of 4.0 cm and carrying equal currents of 10A along opposite directions. Find the magnitude of the
magnetic field B at the points $A_{1}, A_{2}, A_{3}$ and $A_{4}$.

## - Watch Video Solution

10. Two parallel wires carry equal currents of 10A along the same direction and are separated by a distance of 2.0 cm . Find the magnetic field at a point which is 2.0 cm away from each of these wires.
11. Two long, straight wires, each carrying a current of 5 A , are placed along the x and y axes respectively.

The currents point along the positive directions of the axes. Find the magnetic fields at the points (a) $(1 m, 1 m)$, (b) (-1m, 1m), (c) ( $-1 m,-1 m$ ) and (d) (1m, $-1 m$ ).

## - Watch Video Solution

12. Four long, straight wires, each carrying a current
of 5.0 A , are placed in a plane as shown in figure . The points of intersection form a square of side 5.0 cm .
(a) Find the magnetic field at the centre $P$ of the
square. (b) $Q_{1}, Q_{2}, Q_{3}$ and $Q_{4}$ are points situated
on the diagonals of the square and at a distance from $P$ that is equal to the length of the diagonal of the square. Find the magnetic fields at these points. '

13. Figure shows a long wire bent at the middle to form a right angle. Show that the magnitudes of the magnetic fields at the points $P, Q, R$ and $S$ are equal and find this magnitude.

14. Consider a straight piece of length $x$ of a wire carrying a current $i$. Let $P$ be $a$ point on the perpendicular bisector of the piece, situated at a distance $d$ from its middle point. Show that for $d \gg x$, the magnetic field at $P$ varies as ( ${ }^{1} 1 / d^{\wedge} 2$ ) whereas for $\mathrm{d} \ll \mathrm{x}$, it varies as $1 / \mathrm{d}$.

## - Watch Video Solution

15. Consider a $10-\mathrm{cm}$ long piece of a wire which carries a current of 10A. Find the magnitude of the magnetic field due to the piece at a point which
makes an equilateral triangle with the ends of the piece.

## - Watch Video Solution

16. A long, straight wire carries a current i. Let ` B _ 1 be
the magnetic field at a point $P$ at a distance $d$ from
the wire. Consider a section of length I of this wire
such that the point P lies on a perpendicular bisector
of the section. Let B_2 be the magnetic field at this
point due to this section only. Find the value of $d / l$ so that B_2 differs from B_1 by $1 \%$.
17. Figure shows a square loop $A B C D$ with edge length $a$. The resistance of the wire $A B C$ is $r$ and that of ADC is $2 r$. Find the magnetic field $B$ at the centre of the loop assuming uniform wires.

## - Watch Video Solution

18. Figure shows a square loop of edge a made of a uniform wire. A current $i$ enters the loop at the point

A and leaves it at the point $C$. Find the magnetic field at the point P which is on the perpendicular bisector of $A B$ at a distance $a / 4$ from it.

## D View Text Solution

19. The wire $A B C$ shown in figure forms an equilateral triangle. Find the magnetic field B at the centre O of
the triangle assuming the wire to be uniform. `

## - Watch Video Solution

20. A wire of length $I$ is bent in the form of an equilateral triangle and carries an electric current i.
(a) Find the magnetic field $B$ at the centre. (b) If the wire is bent in the form of a square, what would be the value of $B$ at the centre?

## D Watch Video Solution

21. A long wire carrying a current i is bent to form a plane angle alpha. Find the magnetic field $B$ at $a$ point on the bisector of this angle situated at a distance x from the vertex. ${ }^{\text {` }}$

## - Watch Video Solution

22. Find the magnetic field $B$ at the centre of $a$ rectangular loop of length I and width b, carrying a current i .

## - Watch Video Solution

23. A regular polygon of $n$ sides is formed by bending
a wire of total length $2 \pi r$ which carries a current i .
(a) Find the magnetic field $B$ at the centre of the polygon. (b) By letting $n \rightarrow \infty$, deduce the expression for the magnetic field at the centre of a circular current.
24. Each of the batteries shown in figure has an emf equal to 5 V . Show that the magnetic field B at the point $P$ is zero for any set of values of the resistances

- $P$

## - Watch Video Solution

25. A straight, long wire carries a current a current
of 20A. Another wire carrying equal current is placed
parallel to it. If the force acting on a length of 10 cm of the second wire is $\left(2.0 \times\left(10^{-5}\right)\right) N$, what is the separation between them?

## - Watch Video Solution

26. Three coplanar parallel wires, each carrying a current of 10 A along the same direction, are placed with a separation 5.0 cm between the consecutive ones. Find the magnitude of the magnetic force per unit length acting on the wires.
27. Two parallel wires separated by a distance of

10 cm carry currents of 10 A and 40 A along the same direction, Where should a third current be placed so that it experience no magnetic force?

## - Watch Video Solution

28. Figure shows a part of an electric circuit. The wires $A B, C D$, and $E F$ are long and have identical resistances. The separation between the neighbouring wires is 1.0 cm . The wires AE and BF have negligible resistances and the ammeter reads 30 A . Calculate the magnetic force per unit length of
$A B$ and $C D .{ }^{`}$

## D Watch Video Solution

29. A long, straight wire is fixed horizontally and carries a current of 50.0 A. A second wire having linear mass $10^{-4} \mathrm{Kg}$ directly above this wire at a separation of 5.0 mm . What current should this second wire carry such that the magnetic repulsion can balance its weight?
30. A square loop $P Q R S$ carrying a current of 6.0 A is placed near a long wire carrying 10 A as shown in figure. (a) Show that the magnetic force acting on the part $P Q$ is equal and opposite to that on the part RS. (b) Find the magnetic force on the square loop.

31. A circular loop of one turn carries a current of 5.00 A . If the magnetic field B at the centre is 0.200 mT , find the radius of the loop.

## - Watch Video Solution

32. A current - carrying circular coil of 100 turns and radius 5.0 cm produces a magnetic field of $\left(6.0 \times 10^{-5}\right) \mathrm{T}$ at its centre. Find the value of the current.

## - Watch Video Solution

33. An electron makes $\left(3 \times 10^{5}\right)$ revolutions per second in a circle of radius 0.5 angstrom. Find the magnetic field $B$ at the centre of the circle.

## - Watch Video Solution

34. A conducting circular loop of radius $a$ is connected to two long, straight wires. The straight
wires carry a current I as shown in figure. Find the
magnetic field $B$ at the centre of the loop.

## - Watch Video Solution

35. Two circular coils of radii 5.0 cm and 10 cm carry equal currents of 2.0 A. The coils have 50 and 100 turns respectively and are placed in such a way that their planes as well as the centres coincide. Find the magnitude of the magnetic field $B$ at the common
centre of the coils if the currents in the coils are (a) in the same sense (b) in the opposite sense.

## - Watch Video Solution

36. Two circular coils of radii 5.0 cm and 10 cm carry equal currents of 2.0 A. The coils have 50 and 100 turns respectively and are placed in such a way that their planes are perpendicular to each other, what would be the magnitude of the magnetic field $B$ at the centre ?
37. A circular loop of radius 20 cm carries a current of

10 A . An electron crosses the plane of the loop with a
speed of ( $2.0 \mathrm{xx}\left(10^{\wedge} 6\right) \mathrm{m} \mathrm{s}^{\wedge}-1$ ). The direction of motion makes an angle of $30^{\wedge} @$ with the axis of the circle and passes through its centre. Find the magnitude of the magnetic force on the electron at the instant it crosses the plane.

## - Watch Video Solution

38. A circular loop of radius $R$ carries a current $I$.

Another circular loop of radius $r($ (tltR) carries a
current I. The plane of the smaller loop makes an
angle of $90^{\wedge} @$ with that of the larger loop. The
planes of the two circles are at right angle to each other. Find the torque acting on the smaller loop.

## - Watch Video Solution

39. A circular loop of radius $r$ carrying a current $i$ is held at the centre of another circular loop of radius
$R(\gg r)$ carrying a current $I$. The plane of the smaller
loop makes an angle of $30^{\circ}$ with that of the larger
loop. It the smaller loop is held fixed in this position by applying a single force at a point on its periphery, what would be the minimum magnitude of this force?
40. Find the magnetic field $B$ due to a semicircular wire of radius 10.0 cm carrying a current of 5.0 A at its centre of curvature .

## - Watch Video Solution

41. A piece of wire carrying a current of 6.00 A is bent in the form of a circular arc of radius 10.0 cm , and it subtends an angle of $120^{\circ}$ at the centre. Find the magnetic field $B$ due to this piece of wire at the centre.
42. A circular loop of radius $r$ carries a current $i$. where should a long, straight wire carrying a current
$4 i$ be placed in the plane of the circle so that the magnetic field at the centre becomes zero?

## - Watch Video Solution

43. A circular coil of 200 turns has a radius of 10 cm and carries a current of 2.0 A . (a) Find the magnitude of the magnetic field $(\vec{B})$ at the centre of the coil.
(b) At what distance from the centre along the axis
of the coil will the field B drop to half its value at the centre?

## - Watch Video Solution

44. A circular loop of radius 4.0 cm is placed in a horizontal plane and carries an electric current of 5.0

A in the clockwise direction as seen from above. Find the magnetic field (a) at a point 3.0 cm above the centre of the loop (b) at a point 3.0 cm below the centre of the loop.
45. A charge of $\left(3.14 \times 10^{-6}\right) \mathrm{C}$ is distributed uniformly over a circular ring of radius 20.0 cm . The ring rotates about its axis with an angular velocity of $60.0 \mathrm{rad}^{`} \mathrm{~s}^{\wedge}-1$. Find the ratio of the electric field to the magnetic field at a point on the axis at a distance of 5.00 cm from the centre.

## - Watch Video Solution

46. A thin but long, hollow, cylindrical tube of radius
$r$ carries a current $i$ along its length. Find the magnitude of the magnetic field at a distance $r / 2$
from the surface (a) inside the tube (b) outside the tube.
47. A long, cylindrical tube of inner and outer radii a and b carries a current i distributed uniformly over its cross section. Find the magnitude of the magnetic field at a point (a) just inside the tube (b) just outside the tube.

## - Watch Video Solution

48. A long, cylindrical wire of radius $b$ carries $a$ current i distributed uniformly over its cross section.

Find the magnitude of the magnetic field at a point inside the wire at a distance a from the axis.

## - Watch Video Solution

49. A solid wire of radius 10 cm carries a current of
5.0 A distributed uniformly over its cross section.

Find the magnetic field $B$ at a point at a distance (a)
2 cm (b) 10 cm and (c) 20 cm away from the axis.
50. Sometimes we show an idealised magnetic field which is uniform in a given region and falls to zero abruptly. One such field is represented in figure . Using Ampere's law over the path PQRS, show that such a field is not possible.

51. Two large metal sheets carry surface currents as shown in figure . The current through a strip of width dl is Kdl where K is a constant. Find the magnetic field at the points $P, Q$ and $R$. ${ }^{`}$

- $P$

- Q

eR

## - Watch Video Solution

52. Consider the situation of the previous problem. A particle having charge q and mass m is projected
from the point $Q$ in a direction going into the plane of the diagram. It is found to describe a circle of radius $r$ between the two plates. Find the speed of the charged particle.

## - Watch Video Solution

53. The magnetic field B inside a long solenoid, carrying a current of 5.00 A , is $\left(3.14 \times 10^{-2}\right) \mathrm{T}$. Find the number of turns per unit length of the solenoid.

## - Watch Video Solution

54. A long solenoid is fabricated by closely winding a wire of radius 0.5 mm over a cylindrical nonmagnetic frame so that the successive turns nearly touch each other. What would be the magnetic field $B$ at the centre of the solenoid if it carries a current of 5 A ?

## - Watch Video Solution

55. A copper wire having resistance 0.01 ohm in each metre is used to wind a 400 turn solenoid of radius
1.0 cm and length 20 cm . Find the emf of a battery which when connected across the solenoid will cause
a magnetic field of $\left(1.0 \times 10^{-2}\right) \mathrm{T}$ near the centre of the solenoid.

## - Watch Video Solution

56. A tightly- wound solenoid of radius a and length I
has n turns per unit length. It carries an electric current $i$. Consider a length $d x$ of the solenoid at a distance x from one end. This contains n dx turns and may be approximated as a circular current Indx.
(a) Write the magnetic field at the center of the solenoid due to this circular current. Integrate this expression under proper limits to find the magnetic field at the center of the solenoid. (b) Verify that if
$l \gg a$, the field tends to $\left(B=\left(\mu_{0} n i\right)\right.$ and if
$a \gg 1$, the field tends to $B=\left(\left(\mu_{0}\right) n i \frac{l}{2} a\right)$. Interpret these results.

## - Watch Video Solution

57. A tightly- wound, long solenoid carries a current of 2.00 A . An electron is found to execute a uniform circular motion inside the solenoid with a frequency of $\left(1.00 \times 10^{8}\right.$ revs $\left.^{-1}\right)$. Find the number of turns per metre in the solenoid.
58. A tightly-wound, long solenoid has $n$ turns per unit length, a radius $r$ and carries a current i. A particle having charge q and mass m is projected from a point on the axis in a direction perpendicular
to the axis. What can be the maximum speed for which the particle does not strike the solenoid?

## - Watch Video Solution

59. A tightly- wound, long solenoid is kept with its axis parallel to a large metal sheet carrying a surface current. The surgace current through a width dl of
the sheet is Kdl and the number of turns per unit length of the solenoid is n . The magnetic field near
the centre of the solenoid is found to be zero. (a)
find the current in the solenoid. (b) If the solenoid is rotated to make its axis perpendicular to the metal sheet, what would be the magnitude of the magnetic field near its centre?

## - Watch Video Solution

60. A capacitor of capacitance $100 \mu F$ is connected to
a battery of 20 volts for a long time and then disconnected from it. It is now connected across a
long solenoid having 4000 turns per meter. It is found that the potential difference across the capacitor drops to $90^{\circ}$ of its maximum value in 2.0
seconds. Estimate the average magnetic field produced at the centre of the solenoid during this period.

## Questions For Short Asnwer

1. Suppose a charged particle moves with a velocity v near a wire carrying an electric current. A magnetic force, therefore, acts on it. If the same particle is seen form a frame moving with velocity v in the same direction the charge will be found at rest. Will the magnetic force become zero in this frame?
2. Can a charged particle be accelerated by a magnetic field? Can its speed be increased?

## - Watch Video Solution

3. Will a current loop placed in a magnetic field always experience a zero force?

## - Watch Video Solution

4. The free electrons in conducting wire are in constant thermal motion. If such a wire, carrying no current, is placed in a magnetic field, is there a magnetic force on each free electron? Is there a magnetic force on the wire?

## - Watch Video Solution

5. Assume that the magnetic field is uniform in a cubical region and is zero outside. Can you project a
charged particle from outside into the field so that
the particle describes a complete circle in the field?
6. An electron beam projected along the positive $x$ axis deflects along the positive $y$-axis deflects. If this deflection is caused by a magnetic field, what is the direction of the field? Can we conclude that is parallel to the $z$-axis?

## - Watch Video Solution

7. Is it possible for a current loop to stay without rotating in a uniform magnetic field? If yes, what should be the orientation of the loop?
8. The net charge in a current carrying wire is zero.

Them, why does a magnetic field exert a force on it?

## - Watch Video Solution

9. The torque on a current loop is zero if the angle between the positive normal and the magnetic field is either $\theta=0$ or $\theta=180^{\circ}$. In which of the two orientations, the equilibrim is stable?

## - Watch Video Solution

10. Verify that the units weber and volt second are the same.

## ( Watch Video Solution

## Objective 2

1. If a charged particle at rest experiences no electromagnetic force, then electric field in that region
2. If a charged particle kept at rest experiences an electromagnetic force,

## - Watch Video Solution

3. If a charged particle projected in a gravity-free room deflects, then

Both fields cannot be zero
A. there must be an electric field
B. there must be an magnetic field
C. both field cannot be zero
D. both fields can be zero

Answer: (c)both field cannot be zero (d)both fields can be zero

## - Watch Video Solution

4. a charged particle moves in a gravity free space without change in velocity. Which of the following is/are possible?
A. $E=0, B=0$
B. $E=0, B \neq 0$
C. $E \neq 0, B=0$
D. $E \neq 0, B \neq 0$

Answer: (a) (b) (d)

## - Watch Video Solution

5. A charged particle moves along a circle under the action of possible constant electric and magnetic fields. Which of the following are possible?
A. $E=0, B=0$
B. $E=0, B \neq 0$
C. $E \neq 0, B=0$
D. $E \neq 0, B \neq 0$

Answer: $E=0, B \neq 0$

## D Watch Video Solution

6. A charged particle goes undeflected in a region containing electric and magnetic field. It is possible that

## - Watch Video Solution

7. If a charged particle goes unaccelerated in a region containing electric and magnetic fields,
8. Two ions have equal masses but one is singlyionized and the other is doubly- ionized. They are pojected from the same place in a uniform magnetic field with the same velocity perpendicular to the field.

## - Watch Video Solution

9. A positively charged particle is moving along the positive $X$-axis.You want to apply a magnetic field for a short time so that the particle may reverse its direction and move parallel to the negative $X$ -
axis.This can be done be applying the magnetic field along.
А. $y$-axis
B. $z$-axis
C. $y$-axis only
D. $z$-axis only

## Answer: (a) (b)

## Questions For Short Answer

1. An electric current flows in a wire from north to south.

What will be the direction of the magnetic field due to this wire at a point.
A. east of the wire,
B. west of the wire,
C. vertically above the wire and
D. vertically below the wire?

## Answer:

2. The magnetic field due to a long straight wire has
been derived in terms of $\mu_{0}, \mathrm{i}$ and d. Express this in terms of var epsilon_ $0, \mathrm{c}, \mathrm{l}$, and d .

## - Watch Video Solution

3. You are facing a circular wire carrying an electric current. The current is clockwise as seen by you. Is the field at the centre coming towards you or going away from you?
4. In Ampere's law $(\oint(\vec{B}) \cdot(\vec{d} l))=\left(\mu_{0}\right) I$, the current outside the curve is not included on the right hand side. Does it mean that the magnetic field

B calculated by using Ampere's law, gives the contribution of only the currents crossing the area bounded by the curve?

## - Watch Video Solution

5. The magnetic field inside a tightly wound, long
solenoid is ` $B=\left(m u_{-} 0\right)$ ni. It suggests that the field does not depend on the total length of the solenoid,
and hence if we add more loops at the ends of a
solenoid the field should not increase. Explain qualitatively why the extra added loops do not have a considerable effect on the field inside the solenoid.

## - Watch Video Solution

6. A long, straight wire carries a current. Is Ampere's
law
valid for a loop that does not enclose the wire, or that
encloses the wire but is not circular?
7. A straight wire carrying an electric current is placed
along the axis of a uniformly charged ring. Will there be a magnetic force on the wire if the ring starts rotating
about the wire? If yes, in which direction?

## - Watch Video Solution

8. Two wires carrying equal currents i each, are placed
perpendicular to each other, just avoiding a contact.
If
one wire is held fixed and the other is free to move

## magnetic forces, what kind of motion wil results?

## - Watch Video Solution

9. Two proton beams going in the same direction repel each
other whereas two wires carrying currents in the

## same

direction attract each other. Explain.

## - Watch Video Solution

10. In order to have a current in a long wire, it should be
connected to a battery or some such device. Can we obtain the magnetic field due to a straight, long wire by
using Ampere's law without mentioning this other part of the circuit?

## - Watch Video Solution

11. Quite often, connecting wires carrying currents in opposite directions are twisted together in using
electrical appliances. Explain how it avoids unwanted magnetic fields.

## - Watch Video Solution

12. Two currents- carrying wires may attract each other. In
absence of other forces, the wires will move towards
each
other increasing the kinetic energy . Does it contradict
the fact that the magnetic force cannot do any work
and
hence cannot increase the kinetic energy?

## - Watch Video Solution

## Others

1. Shows a rod PQ of length 20.0 cm and mass 200 g suspended through a fixed point O by two threads of lengths 20.0 cm each. A magnetic field of strenght 0.500 T exists in the vicinity of the wire PQ as shown in the figure. The exists in the vicinity of the wire PQ as shown in the figure. The wires conecting PQ with the battery are loose and exert no force on PQ.(a) find the tension in the threads when the switch S is open. (b) A current of 2.0 A is established when the
switch S is closed. Find the tension in the threads
now.
