## MAGNETIC FIELD DUE TO CURRENT

Example

1. A wire placed along north-south direction
carries a current of 10 A from south to north.

Find the magnetic field due to a 1 cm piece of wire at a point 200 cm north-east from the piece.

## D Watch Video Solution

2. The two long, straight wires carrying electric
currents in opposite directions. The
separation between the wires is 5.0 cm . Find
the magnetic field at a point $P$ midway between the wires.
3. The long, staight wires, each carrying an electric current of 5.0 A , are kept parallel to each other at a separation of 2.5 cm . Find the magnitude of the magnetic force experienced by 10 cm of a wire.

## - Watch Video Solution

4. A circular coil of radius
$1 \cdot 5$ cmcarriesacurrentof $1 \cdot 5$. If the coil
has 25 turns, find the magnetic field at the centre.

## D Watch Video Solution

5. A long solenoid is formed by winding 20 turns $\mathrm{cm}^{-1}$. What current is necessary to produce a magnetic field of 20 mT inside the solenoid?

## Worked Out Examples

1. Two long wires $a$ and $b$, carrying equal currents of $10 * 0 \mathrm{~A}$, are placed parallel to each other with a separation of $4 * 00 \mathrm{~cm}$ between them as shown in figure. Find the magnetic field $B$ at each of the points $P, Q$ and $R$.

2. Two parallel wires $P$ and $Q$ placed at $a$ separation
$d=6 \mathrm{~cm}$ carry electric currents $\mathrm{i}_{-} 1=5 \mathrm{~A}$ and
i_2= 2A in opposite directions as shown in
figure. Find the point on the line $P Q$ where the resultant magnetic field `
is zero.

(a)

(b)

- Watch Video Solution

3. Two long, straight wires $a$ and $b$ are $2 \cdot 0$ m apart,
perpendicular to the plane of the paper as shown in figure
. The wire a carries a current of $9 \cdot 6 A$ directed into the plane of the figure,The magnetic field at the
point $P$ at a distance of $10 / 11 \mathrm{~m}$ from the wire $b$ is zero.

Find (a) the magnitude and direction of the current in $b$,
(b) the magnitude of the magnetic field $B$ at
the point s
and (c) the force per unit length on the wire b.

4. A current of $2 \cdot 00 A$ exists in a square loop of edge $10 \cdot 0 \mathrm{~cm}$. Find the magnetic field $B$ at the centre of the square loop.

## D Watch Video Solution

5. Figure shows a square loop made from a uniform
wire. Find the magnetic field at the centre of
the square
if a battery is connected between the points $A$
and C .

## D Watch Video Solution

6. Two long wires, carrying currents $i_{1}$ and $i_{2}$, are placed perpendicular to each other in such
a way that they just avoid a contact. Find the magnetic force on a small length dl of the second wire situated at a distance I from the first wire. (figure)

7. Figure shows a part of an electric circuit.
$A B C D$ is a rectangular loop made of uniform
wire. The length $A D=B C=1 \mathrm{~cm}$. The sides $A B$
and DC are long as compared to the other two
sides. Find the magnetic force per unit length
acting on the wire $D C$ due to the wire $A B$ if the ammeter reads 10A.

## - Watch Video Solution

8. Figure shows a current loop having two
circular arcs joined by two radial lines. Find
the magnetic field $B$ at the centre $O$.

(D) Watch Video Solution
9. Find the magnetic field at the point $P$ in
figure. The curved portion is a semicircle and the straight wires are long.

D Watch Video Solution
10. The magnetic field $B$ due to a currentcarrying circular loop of radius 12 cm at its
center is $0.50 \times\left(10^{-4}\right) T$. Find the magnetic field due to this loop at a point on the axis at a distance of 5.0 cm from the centre.

## - Watch Video Solution

11. Consider a coaxial cable which consists of an inner wire of radius a surrounded by an outer shell of inner and outer radii $b$ and $c$ respectively. The inner wire carries an electric current `(i_0) and the outer shell carries an equal current in opposite direction. Find the
magnetic field at a distance $x$ from the axis
where (a) xlta, (b) altxltb, (c) bltxltc and
(d)xgtc. Assume that the current density is
uniform in the inner wire and also uniform in
the outer shell.

D View Text Solution
12. Figure shows a cross section of a large metal. Sheet carrying an electric current along
its surface. The current in a strip of width dl is

Kdl where K is a constant. Find the magnetic
field at a point $P$ at a distance $x$ from the metal sheet.

## - Watch Video Solution

13. Consider the situation described in the previous example. A particle of mass $m$ having a charge q is placed at a distance d from the
metal sheet and is projected towards it. Find the maximum velocity of projection for which the particle does not hit the sheet.

## D Watch Video Solution

14. Three identical long solenoids $P, Q$ and $R$ are connected to each other as shown in
figure . If the magnetic field at the centre of $P$ is 2.0 T , what would be the field at the centre of $Q$ ? Assume that the field due to any solenoid is confined within the volume of that
solenoid only.

(a)

(b)

## D Watch Video Solution

15. A long, straight wire carries a current i. A particle having a positive charge $q$ and mass m , kept at a distance $x_{-} 0$ from the wire is projected towards it with a speed v. Find the minimum separation between the wire and
the particle.

R

## D View Text Solution

## Objective 1

1. A vertical wire carries a current in upward direction. An electron beam sent horizontally towards the wire will be deflected
A. towards right
B. towards left
C. upwards
D. downwards

## Answer: C

## D Watch Video Solution

2. A current- carrying straight wire is kept along the axis of a circular loop carrying a current. The straight wire
A. will exert an inward force on the circular loop
B. will exert an outward force on the
circular loop
C. will not exert any force on the circular loop
D. will exert a force on the circular loop
parallel to itself.

Answer: C

D Watch Video Solution
3. A proton beam is going from north to south
and an electron beam is going from south to
north. Neglecting the earth's magnetic field,
the electron beam will be deflected
A. towards the proton beam
B. away from the proton beam
C. upwards
D. downwards

## - Watch Video Solution

4. A circular loop is kept in that vertical plane which contains the north- south direction. It carries a current that is towards north at the topmost point. Let A be a point on the axis of the circle to the east of it and $B$ a point on this axis to the west of it. The magnetic field due to the loop.
A. is towards east at $A$ and towards west at
B. is towards west at A and towards east at B
$C$. is towards east at both $A$ and $B$
D. is towards west at both $A$ and $B$.

## Answer: D

D Watch Video Solution
5. Consider the situation shown in figure. The straight wire is fixed but the loop can move
under magnetic force. The loop will

A. remain stationary
B. move towards the wire
C. move away form the wire
D. rotate about the wire.

Answer: B

## - Watch Video Solution

6. A charged particle is moved along a magnetic field line. The magnetic force on the particle is
A. along its velocity
B. opposite to its velocity
C. perpendicular to its velocity
D. zero.

## Answer: D

## - Watch Video Solution

## 7. A moving charge produces

A. electric field only
B. magnetic field only
C. both of them
D. none of them.

## - Watch Video Solution

8. A particle is projected in a plane perpendicular to a uniform magnetic field. The area bounded by the path described by the particle is proportional to
A. the velocity
B. the momentum
C. the kinetic energy
D. none of them.

## D Watch Video Solution

9. Two particle $X$ and $Y$ having equal charge,
after being accelerated through the same
potential difference enter a region of uniform magnetic field and describe circular paths of
radii $R_{1}$ and $R_{2}$ respectively. The ratio of the mass of $X$ to that of $Y$ is

$$
\text { A. }\left(\frac{\left(\frac{R_{1}}{R_{2}}\right)^{1}}{2}\right)
$$

B. $\frac{R_{1}}{R_{2}}$
C. $\left(\frac{R_{1}}{R_{2}}\right)^{2}$
D. $\left(R_{1}\right)\left(R_{2}\right)$

Answer: C

D Watch Video Solution
10. Two parallel wires carry currents of 20A and

40A in opposite directions. Another wire carrying a current antiparallel to 20A is placed
midway between the two wires. The magnetic

## force on it will be

A. towards 20 A
B. towards 40 A
C. zero
D. perpendicular to the plane of the
currents .

Answer: B
11. Two parallel, long wires carry currents
$i_{1}$ and $i_{2}$ with $i_{1}>i_{2}$. When the currents are
in the same direction, the magnetic field at a point midway between the wires is 10 mu T . If the direction of $i_{2}$ is reversed, the field becomes 30 mu T . The ration $\frac{i_{1}}{i_{2}}$ is
A. 4
B. 3
C. 2
D. 1

Answer: C

## - Watch Video Solution

12. Consider a long, straight wire of crosssectional area A carrying a current i. Let there
be n free electrons per unit volume. An observed places himself on a trolley moving in
the direction opposite to the current with a moving in the direction opposite to the current with a speed ${ }^{\prime}(\mathrm{v}=\mathrm{i} / \mathrm{nAe})$ and separated
from the wire by a distance $r$. The magnetic
field seen by the observer is very nearly
A. $\frac{\mu_{0} i}{2 \pi r}$
B. zero
C. $\frac{\mu_{0} i}{\pi r}$
D. $\frac{\left(2 \mu_{0}\right) i}{\pi r}$

Answer: A
(D) Watch Video Solution

Objective 2

1. The magnetic field at the origin due to a current element
$(\vec{d} l)$ placedataposi $\rightarrow n(\vec{r})$ is
A. $\left(\left(\frac{\mu_{0} i}{4 \pi}\right) \frac{\overrightarrow{d l} \times \vec{r}}{r^{3}}\right)$
B. $\left(-\left(\left(\mu_{0}\right) \frac{i}{4 \pi}\left(\vec{r} \times \frac{\overrightarrow{d l}}{r^{3}}\right)\right)\right)$
C. $\left(\left(\mu_{0}\right) \frac{i}{4 \pi}\left(\vec{r} \times \frac{\overrightarrow{d l}}{r^{3}}\right)\right)$
D. $\left(-\left(\left(\mu_{0}\right) \frac{i}{4 \pi} \frac{\overrightarrow{d l} \times \vec{r}}{r^{3}}\right)\right)$

## - Watch Video Solution

2. Consider three quantities ( $x=E / B, y=$ (sqrt(1/((mu_0)(epsilon_0)))) and $z=(1 / C R)$ '.

Here, $I$ is the length of a wire, $C$ is a capacitance and R is a resistance. All other symbols have standard meanings.
A. $x, y$ have the same dimensions.
B. $y, z$ have the same dimensions.
C. $z, x$ have the same dimensions.

# D. none of the three pairs have the same 

## dimensions.

## Answer: A::B::C

## D Watch Video Solution

3. A long, straight wire carries a current along
the $z$-axis. One can find two points in the $x-y$ plane such that
A. the magnetic fields are equal
B. the directions of the magnetic fields are the same
C. the magnitudes of the magnetic fields
are equal
D. the field at one point is opposite to that at the other point.

## Answer: B::C::D

## D Watch Video Solution

4. A long, straight wire of radius $R$ carries a current distributed uniformly over its cross section. The magnitude of the magnetic field is
A. maximum at the axis of the wire
B. minimum at the axis of the wire
C. maximum at the surface of the wire
D. minimum at the surface of the wire.

Answer: B::C

D Watch Video Solution
5. A hollow tube is carrying an electric current along its length distributed uniformly over its
surface. The magnetic field
A. increase linearly from the axis to the
surface.
B. is constant inside the tube
C. is zero at the axis
D. is zero just outside the tude.

Answer: B::C
6. In a coaxial, straight cable, the central conductor and the outer conductor carry equal currents in opposite directions. The magnetic field is zero.
A. outside the cable
B. inside the inner conductor
C. inside the outer conductor
D. in between the two conductor

## D Watch Video Solution

7. A steady electric current is flowing through
a cylindrical conductor. Then,
A. The electric field at the axis of the
conductor is zero.
B. The magnetic field at the axis of the conductor is zero.
C. The electric field in the vicinity of the
conductor is zero.
D. The magnetic field in the vicinity of the conductor is zero.

Answer: B::C

D Watch Video Solution

Exercise

1. Using the formulae
$(\vec{F})=(\vec{q} v) \times(\vec{B})$ and $B=\left(\mu_{0}\right) \frac{i}{2 \pi r}$
,find the SI units of the magnetic field $B$ and the permeability constant

## - Watch Video Solution

2. A current of 10A is established in a long wire along the positive $z$-axis. Find the magnetic field ${ }^{`}(\mathrm{vec} B)$ at the point ( $1 \mathrm{~m}, 0,0$ ).
3. A copper wire of diameter 1.6 mm carries a current of 20A. Find the maximum magnitude of the magnetic field (vec B)due to this current.

## - Watch Video Solution

4. A transmission wire carries a current of

100A. What would be the magnetic field $B$ at a point on the road if the wire is 8 m above the road?

## - Watch Video Solution

5. A long, straight wire carrying a current of 1.0

A is placed horizontally in a uniform magnetic
field $B=\left(1.0 \times 10^{-5}\right) T$ pointing vertically upward. Find the magnitude of the resultant magnetic field at the points P and Q , both situated at a distance of 2.0 cm from the wire
in the same horizontal plane.

## $P \cdot$

## Q. B $\odot$

## D Watch Video Solution

6. A long, straight wire of radius $r$ carries a current $i$ and is placed horizontally in a uniform magnetic field $B$ pointing vertically upward. The current is uniformly distributed over its cross section. (a) At what points will
the resultantant magnetic field have maximum magnitude? What will be the maximum magnitude? (b) What will be the minimum magnitude of the resultant magnetic field?

## D Watch Video Solution

7. A long, vertical straight wire carrying a current of 30 A is placed in an external, uniform magnetic field of $\left(4.0 \times\left(10^{-4}\right)\right.$ T exists from south to north. Find magnetic field at a point 2.0 away from the wire.

## Watch Video Solution

8. A long vertical wire carrying a current of 10A in the upward direction is placed in a region where a horizontal magnetic field of magnitude $\left(2.0 \times 10^{-3}\right)$ T exists from south to north. Find the point where the resultant magnetic field is zero.

## D Watch Video Solution

9. Figure shows two parallel wires separated by a distance of 4.0 cm and carrying equal currents of 10A along opposite directions. Find the magnitude of the magnetic field $B$ at the points $A_{1}, A_{2}, A_{3}$ and $A_{4}$.

10. Two parallel wires carry equal currents of 10A along the same direction and are separated by a distance of 2.0 cm . Find the magnetic field at a point which is 2.0 cm away from each of these wires.

## D Watch Video Solution

11. Two long, straight wires, each carrying a current of 5 A , are placed along the x and y axes respectively. The currents point along the
positive directions of the axes. Find the magnetic fields at the points (a) (1m, 1m), (b) $(-1 m, 1 m),(c)(-1 m,-1 m)$ and (d) (1m, $-1 m)$.

## D Watch Video Solution

12. Four long, straight wires, each carrying a current of 5.0 A , are placed in a plane as
shown in figure. The points of intersection form a square of side 5.0 cm . (a) Find the magnetic field at the centre $P$ of the square.
(b) $Q_{1}, Q_{2}, Q_{3}$ and $Q_{4}$ are points situated on
the diagonals of the square and at a distance
from $P$ that is equal to the length of the diagonal of the square. Find the magnetic fields at these points.

## D Watch Video Solution

13. Figure shows a long wire bent at the middle to form a right angle. Show that the magnitudes of the magnetic fields at the points $P, Q, R$ and $S$ are equal and find this magnitude. `

14. Consider a straight piece of length x of a wire carrying a current i. Let P be a point on the perpendicular bisector of the piece, situated at a distance $d$ from its middle point.

Show that for $d \gg x$, the magnetic field at $P$ varies as ( $1 / \mathrm{d}^{\wedge} 2$ ) whereas for $\mathrm{d} \ll \mathrm{x}$, it varies as 1/d.
15. Consider a $10-\mathrm{cm}$ long piece of a wire which carries a current of 10A. Find the magnitude of the magnetic field due to the piece at a point which makes an equilateral triangle with the ends of the piece.

## D Watch Video Solution

16. A long, straight wire carries a current i. Let
'B_1 be the magnetic field at a point $P$ at a distance $d$ from the wire. Consider a section of
length I of this wire such that the point P lies on a perpendicular bisector of the section. Let

B_2 be the magnetic field at this point due to this section only. Find the value of $d / l$ so that B_2 differs from B_1 by 1 \%.

## D Watch Video Solution

17. Figure shows a square loop $A B C D$ with edge length $a$. The resistance of the wire $A B C$ is $r$ and that of $A D C$ is $2 r$. Find the magnetic field $B$ at the centre of the loop assuming uniform
wires.

## D Watch Video Solution

18. Figure shows a square loop of edge a made of a uniform wire. A current $i$ enters the loop at the point $A$ and leaves it at the point $C$. Find the magnetic field at the point $P$ which is on
the perpendicular bisector of $A B$ at a distance a/4 from it.

## D View Text Solution

19. The wire $A B C$ shown in figure forms an equilateral triangle. Find the magnetic field $B$ at the centre O of the triangle assuming the
wire to be uniform. ${ }^{`}$

D Watch Video Solution
20. A wire of length $I$ is bent in the form of an equilateral triangle and carries an electric current i. (a) Find the magnetic field $B$ at the centre. (b) If the wire is bent in the form of a square, what would be the value of $B$ at the centre?

## - Watch Video Solution

21. A long wire carrying a current $i$ is bent to form a plane angle alpha. Find the magnetic
field $B$ at a point on the bisector of this angle situated at a distance $x$ from the vertex.

## D Watch Video Solution

22. Find the magnetic field $B$ at the centre of a rectangular loop of length $I$ and width $b$, carrying a current i .

D Watch Video Solution
23. A regular polygon of $n$ sides is formed by
bending a wire of total length $2 \pi r$ which
carries a current i. (a) Find the magnetic field $B$
at the centre of the polygon. (b) By letting
$n \rightarrow \infty$, deduce the expression for the magnetic field at the centre of a circular current.

## - Watch Video Solution

24. Each of the batteries shown in figure has
an emf equal to 5 V . Show that the magnetic
field $B$ at the point $P$ is zero for any set of values of the resistances .

- P

## D Watch Video Solution

25. A straight, long wire carries a current a current of 20A. Another wire carrying equal current is placed parallel to it. If the force acting on a length of 10 cm of the second wire is $\left(2.0 \times\left(10^{-5}\right)\right) N$, what is the separation between them?

## D Watch Video Solution

26. Three coplanar parallel wires, each carrying a current of 10 A along the same direction, are
placed with a separation 5.0 cm between the consecutive ones. Find the magnitude of the magnetic force per unit length acting on the wires.

## D Watch Video Solution

27. Two parallel wires separated by a distance of 10 cm carry currents of 10 A and 40 A along
the same direction, Where should a third current be placed so that it experience no magnetic force?
28. Figure shows a part of an electric circuit.

The wires $A B, C D$, and $E F$ are long and have identical resistances. The separation between the neighbouring wires is 1.0 cm . The wires AE and BF have negligible resistances and the ammeter reads 30 A . Calculate the magnetic force per unit length of $A B$ and $C D$. `

## Watch Video Solution

29. A long, straight wire is fixed horizontally and carries a current of 50.0 A. A second wire
having linear mass $10^{-4} \mathrm{Kg}$ directly above this
wire at a separation of 5.0 mm . What current
should this second wire carry such that the magnetic repulsion can balance its weight?

## - Watch Video Solution

30. A square loop PQRS carrying a current of 6.0 A is placed near a long wire carrying 10 A as shown in figure . (a) Show that the magnetic force acting on the part PQ is equal and opposite to that on the part RS. (b) Find the magnetic force on the square loop.

31. A circular loop of one turn carries a current of 5.00 A. If the magnetic field $B$ at the centre is 0.200 mT , find the radius of the loop.

## D Watch Video Solution

32. A current - carrying circular coil of 100 turns and radius 5.0 cm produces a magnetic field of $\left(6.0 \times 10^{-5}\right) \mathrm{T}$ at its centre. Find the value of the current.
33. An electron makes $\left(3 \times 10^{5}\right)$ revolutions per second in a circle of radius 0.5 angstrom.

Find the magnetic field $B$ at the centre of the circle.

## - Watch Video Solution

34. A conducting circular loop of radius a is connected to two long, straight wires. The straight wires carry a current I as shown in
figure. Find the magnetic field $B$ at the centre of the loop.

## D Watch Video Solution

35. Two circular coils of radii 5.0 cm and 10 cm carry equal currents of 2.0 A . The coils have 50 and 100 turns respectively and are placed in
such a way that their planes as well as the
centres coincide. Find the magnitude of the magnetic field $B$ at the common centre of the coils if the currents in the coils are (a) in the same sense (b) in the opposite sense.

## D Watch Video Solution

36. Two circular coils of radii 5.0 cm and 10 cm
carry equal currents of 2.0 A. The coils have 50
and 100 turns respectively and are placed in
such a way that their planes are perpendicular
to each other, what would be the magnitude of the magnetic field $B$ at the centre ?

## D Watch Video Solution

37. A circular loop of radius 20 cm carries a current of 10 A . An electron crosses the plane of the loop with a speed of ( $2.0 \times x\left(10^{\wedge} 6\right) \mathrm{m}$ $\left.s^{\wedge}-1\right)$. The direction of motion makes an angle of $30^{\wedge} @$ with the axis of the circle and passes
through its centre. Find the magnitude of the
magnetic force on the electron at the instant it crosses the plane.

## D Watch Video Solution

38. A circular loop of radius $R$ carries a current
I. Another circular loop of radius $r(|t| t R)$ carries
a current I . The plane of the smaller loop makes an angle of 90^@ with that of the larger loop. The planes of the two circles are at right angle to each other. Find the torque acting on the smaller loop.
39. A circular loop of radius $r$ carrying $a$ current i is held at the centre of another circular loop of radius $R(\gg r)$ carrying a current I. The plane of the smaller loop makes an angle of $30^{\circ}$ with that of the larger loop. It
the smaller loop is held fixed in this position by applying a single force at a point on its periphery, what would be the minimum magnitude of this force?
40. Find the magnetic field $B$ due to $a$ semicircular wire of radius 10.0 cm carrying a current of 5.0A at its centre of curvature .

## D Watch Video Solution

41. A piece of wire carrying a current of 6.00 A
is bent in the form of a circular arc of radius
10.0 cm , and it subtends an angle of $120^{\circ}$ at
the centre. Find the magnetic field $B$ due to
this piece of wire at the centre.

## - Watch Video Solution

42. A circular loop of radius $r$ carries a current
i. where should a long, straight wire carrying a
current $4 i$ be placed in the plane of the circle so that the magnetic field at the centre becomes zero?
43. A circular coil of 200 turns has a radius of

10 cm and carries a current of 2.0 A . (a) Find the magnitude of the magnetic field $(\vec{B})$ at the centre of the coil. (b) At what distance from the centre along the axis of the coil will the field $B$ drop to half its value at the centre?

## D Watch Video Solution

44. A circular loop of radius 4.0 cm is placed in
a horizontal plane and carries an electric
current of 5.0 A in the clockwise direction as seen from above. Find the magnetic field (a) at a point 3.0 cm above the centre of the loop (b) at a point 3.0 cm below the centre of the loop.

## D Watch Video Solution

45. A charge of $\left(3.14 \times 10^{-6}\right) \mathrm{C}$ is distributed
uniformly over a circular ring of radius 20.0
cm . The ring rotates about its axis with an
angular velocity of 60.0 rad ` $s^{\wedge}-1$. Find the
ratio of the electric field to the magnetic field
at a point on the axis at a distance of 5.00 cm

## from the centre.

## D Watch Video Solution

46. A thin but long, hollow, cylindrical tube of radius $r$ carries a current $i$ along its length.

Find the magnitude of the magnetic field at a distance $r / 2$ from the surface (a) inside the tube (b) outside the tube.
47. A long, cylindrical tube of inner and outer radii a and b carries a current i distributed uniformly over its cross section. Find the magnitude of the magnetic field at a point (a) just inside the tube (b) just outside the tube.

## - Watch Video Solution

48. A long, cylindrical wire of radius $b$ carries $a$ current i distributed uniformly over its cross section. Find the magnitude of the magnetic
field at a point inside the wire at a distance a from the axis.

## D Watch Video Solution

49. A solid wire of radius 10 cm carries a current of 5.0 A distributed uniformly over its cross section. Find the magnetic field $B$ at $a$ point at a distance (a) 2 cm (b) 10 cm and (c) 20 cm away from the axis.

## D Watch Video Solution

50. Sometimes we show an idealised magnetic
field which is uniform in a given region and falls to zero abruptly. One such field is represented in figure . Using Ampere's law over the path PQRS, show that such a field is not possible.

51. Two large metal sheets carry surface currents as shown in figure . The current through a strip of width dl is Kdl where K is a constant . Find the magnetic field at the points $P, Q$ and R. ${ }^{\text {. }}$
-P

-R

## D Watch Video Solution

52. Consider the situation of the previous problem. A particle having charge $q$ and mass $m$ is projected from the point $Q$ in a direction going into the plane of the diagram. It is found to describe a circle of radius $r$ between the two plates. Find the speed of the charged particle.

## D Watch Video Solution

53. The magnetic field $B$ inside a long solenoid, carrying a current of 5.00 A , is $\left(3.14 \times 10^{-2}\right)$
T. Find the number of turns per unit length of the solenoid.

## - Watch Video Solution

54. A long solenoid is fabricated by closely winding a wire of radius 0.5 mm over a cylindrical nonmagnetic frame so that the successive turns nearly touch each other.

What would be the magnetic field $B$ at the centre of the solenoid if it carries a current of 5 A?

## D Watch Video Solution

55. A copper wire having resistance 0.01 ohm
in each metre is used to wind a 400 turn
solenoid of radius 1.0 cm and length 20 cm .

Find the emf of a battery which when connected across the solenoid will cause a
magnetic field of $\left(1.0 \times 10^{-2}\right) \mathrm{T}$ near the centre of the solenoid.

## D Watch Video Solution

56. A tightly- wound solenoid of radius a and length I has n turns per unit length. It carries an electric current i . Consider a length dx of the solenoid at a distance $x$ from one end. This contains ndx turns and may be approximated as a circular current I n dx . (a) Write the magnetic field at the center of the solenoid
due to this circular current. Integrate this expression under proper limits to find the magnetic field at the center of the solenoid.
(b) Verify that if $l \gg a$, the field tends to ( $B=\left(\mu_{0} n i\right)$ and if $a \gg 1$, the field tends to $B=\left(\left(\mu_{0}\right) n i \frac{l}{2} a\right)$. Interpret these results.

## - Watch Video Solution

57. A tightly- wound, long solenoid carries a current of 2.00 A . An electron is found to execute a uniform circular motion inside the

# solenoid <br> with <br> a frequency <br> $\left(1.00 \times 10^{8}\right.$ revs $\left.^{-1}\right)$. Find the number of turns 

per metre in the solenoid.

## D Watch Video Solution

58. A tightly-wound, long solenoid has $n$ turns per unit length, a radius $r$ and carries $a$ current i. A particle having charge $q$ and mass $m$ is projected from a point on the axis in a direction perpendicular to the axis. What can
be the maximum speed for which the particle does not strike the solenoid?

## D Watch Video Solution

59. A tightly- wound, long solenoid is kept with its axis parallel to a large metal sheet carrying a surface current. The surgace current through a width dl of the sheet is Kdl and the number of turns per unit length of the solenoid is $n$. The magnetic field near the centre of the solenoid is found to be zero. (a)
find the current in the solenoid. (b) If the solenoid is rotated to make its axis perpendicular to the metal sheet, what would be the magnitude of the magnetic field near its centre?

## D Watch Video Solution

60. A capacitor of capacitance $100 \mu F$ is connected to a battery of 20 volts for a long
time and then disconnected from it. It is now connected across a long solenoid having 4000
turns per meter. It is found that the potential
difference across the capacitor drops to $90^{\circ}$ of its maximum value in 2.0 seconds. Estimate the average magnetic field produced at the centre of the solenoid during this period.

## Questions For Short Answer

1. An electric current flows in a wire from north
to south.

What will be the direction of the magnetic field due to this wire at a point.
A. east of the wire,
B. west of the wire,
C. vertically above the wire and
D. vertically below the wire?

## Answer:

## D Watch Video Solution

2. The magnetic field due to a long straight wire has been derived in terms of $\mu_{0}, \mathrm{i}$ and d .

Express this in terms of var epsilon_0, c, I, and d.

## - Watch Video Solution

3. You are facing a circular wire carrying an electric current. The current is clockwise as seen by you. Is the field at the centre coming towards you or going away from you?
4. In Ampere's law $(\oint(\vec{B}) \cdot(\vec{d} l))=\left(\mu_{0}\right) I$
, the current outside the curve is not included on the right hand side. Does it mean that the magnetic field B calculated by using Ampere's
law, gives the contribution of only the currents crossing the area bounded by the curve?

- Watch Video Solution

5. The magnetic field inside a tightly wound,
long solenoid is ` $B=\left(m_{-} 0\right)$ ni. It suggests that
the field does not depend on the total length
of the solenoid, and hence if we add more
loops at the ends of a solenoid the field
should not increase. Explain qualitatively why
the extra added loops do not have a considerable effect on the field inside the solenoid.
6. A long, straight wire carries a current. Is

Ampere's law
valid for a loop that does not enclose the wire,
or that
encloses the wire but is not circular?

## - Watch Video Solution

7. A straight wire carrying an electric current is
placed
along the axis of a uniformly charged ring. Will
there
be a magnetic force on the wire if the ring starts rotating
about the wire? If yes, in which direction?

## D Watch Video Solution

8. Two wires carrying equal currents $i$ each, are
placed
perpendicular to each other, just avoiding a contact. If
one wire is held fixed and the other is free to move under
magnetic forces, what kind of motion wil

## results?

- Watch Video Solution

9. Two proton beams going in the same direction repel each
other whereas two wires carrying currents in
the same
direction attract each other. Explain.

- Watch Video Solution

10. In order to have a current in a long wire, it should be
connected to a battery or some such device.

Can we
obtain the magnetic field due to a straight,
long wire by
using Ampere's law without mentioning this
other part of the circuit?

D Watch Video Solution
11. Quite often, connecting wires carrying currents in opposite directions are twisted together in using electrical appliances. Explain how it avoids unwanted magnetic fields.

## - Watch Video Solution

12. Two currents- carrying wires may attract
each other. In
absence of other forces, the wires will move towards each
other increasing the kinetic energy . Does it

## contradict

the fact that the magnetic force cannot do any

## work and

hence cannot increase the kinetic energy?
